शासकीय अभियांत्रिकी महाविद्यालय, औरंगाबाद

## **Department of Electronics and Telecommunication**

# **ET3012: Lab Computer Architecture And Organization**

**Name :** Ram Shingane

**Enrollment No :** BE19F04F059

**Class :** TY (ENTC)

**Batch :** T4

# **EXPERIMENT NO. 01**

**AIM:** Write and execute following program for 8085 processor

- a. Addition of two 8-bit numbers stored in memory, also store result in memory.
- b. To count no of 1's and 0's in a given byte.
- c. To obtain division of two 8-bit numbers.
- d. To move a block of data. (10 numbers from one memory location to another)
- e. To arrange 10 random numbers in ascending as well as in descending order.
- f. To obtain Fibonacci series.
- g. To obtain factorial of a number.

**THEORY:** 8085 is pronounced as ‘Eighty-Eighty-Five’ microprocessor. It is an 8bit microprocessor designed by Intel in 1977 using NMOS technology. It has following configurations:-

- 8-bit data bus
- 16-bit address bus, which can address up to 64kb
- A 16-bit programmer counter
- A 16-bit stack pointer
- six 8-bit registers arranged in pairs:-BC,DF,HL
- Requires +5V supply to operate at 3.2MHz single phase clock
- It is used in washing machines, micro-wave oven, mobile phones, etc.

## **FUNCTIONAL UNITS OF 8085 MICROPROCESSER:-**

**Accumulator:** It is an 8-bit register used to perform arithmetic, logical, I/O & LOAD/STORE operation. It is connected to internal data bus ALU.

**Arithmetic & Logic Unit:** As the name suggests, it performs arithmetic & logical operations like Addition, Subtraction, AND, OR on 8-bit data.

**General Purpose Register:** There are 6 general purpose registers in 8085 processors, i.e. B,C,D,F,H & L. Each register can hold 8-bit data. These registers can work in pair to hold 16-bit

data.

**Program Counter:** It is the 16-bit register used to store the memory address location of next instruction to be executed. Microprocessor increments the program wherever an instruction is being executed ,so that program counter points to memory address of next instruction that is going to be executed.

**Stack Pointer:** It is also 16-bit register works like stack which is always incremented /decremented by 2 during push & pop operations.

**Temporary register:** It is an 8-bit register which holds the temporary data of arithmetic & logical operation.

**Address Bus & Data Bus:** Data bus carries the data to be stored .It is bidirectional, whereas address bus carries the location to where it should be stored & it is unidirectional .It is used to transfer the data & address I/O devices.

**Addressing Modes in 8085:** These are the instructions used to transfer the data from one register to another register ,from the memory to the register, and from the memory to the register and from register to memory without any alteration in the content .Addressing modes in 8085 are classified into 5 groups:-

**1) Immediate Addressing Mode:-** In this mode ,the 8/16-bit data is specified in the instructions itself as one of its operands .e.g.: MVI K,20F ; 20F is copied into register K.

**2) Direct Addressing Mode:-** In this mode, the data is directly copied from the given address to the register

.e.g.: LDB 5000 K; means the data at address 5000K is copied to register B.

**3) Indirect Addressing Mode:-** In this mode, the data is transferred from one register to another by using the address pointed by the register to another .e.g.: MOV K,B ; means data is transferred from the memory address pointed by the register to register K.

**4) Implied Addressing Mode:-** This mode doesn't require any operand ;the data is specified by the e.g. :CMP

### a. Addition on two 8 bit numbers-

Input :

**CODE:**

```

//Addition of two 8 bit numbers-
# ORG 7000H

LXI H,7501      // Get address of 1st no in HL pair

MOV A,M          // Move no into accumulator

INX H            // HL points the address 7502 H

ADD M            // Add the 2nd no.

INX H            // HL points 7503 H

MOV M,A          // Store result in 7503 H

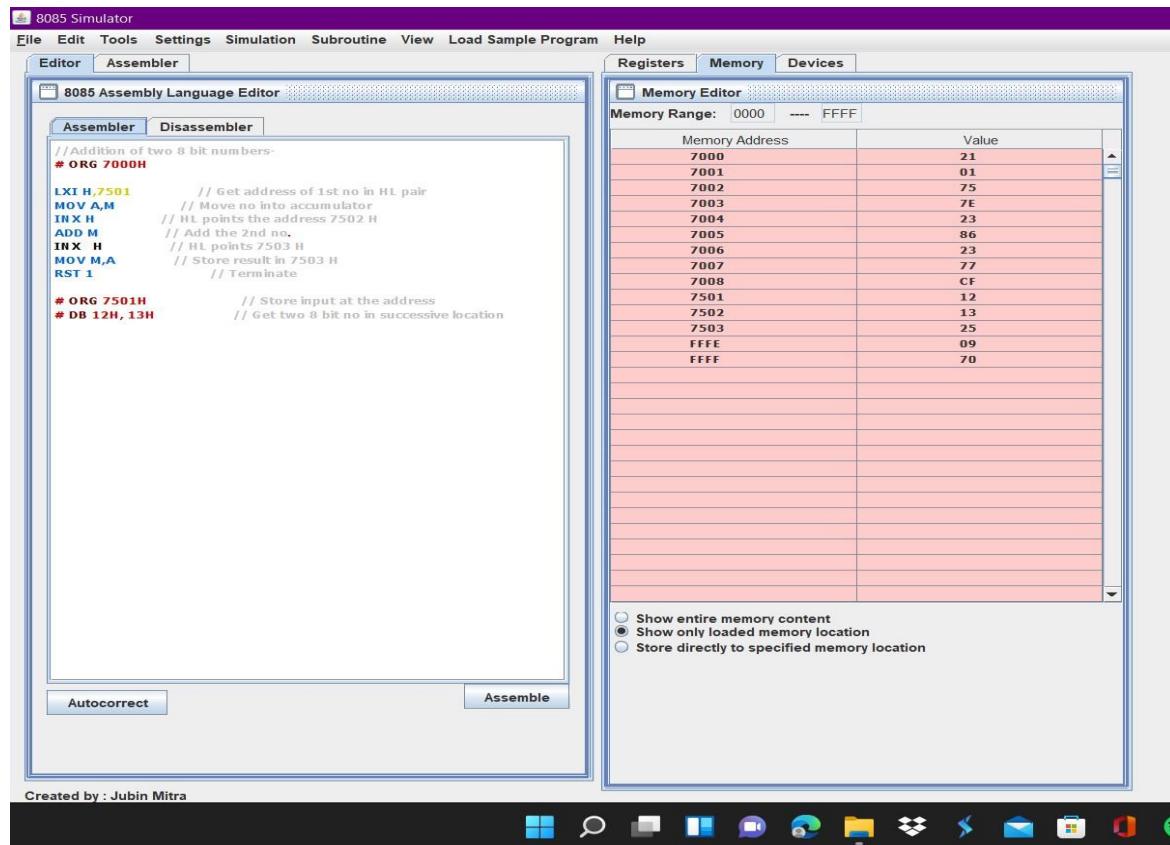

RST 1            // Terminate

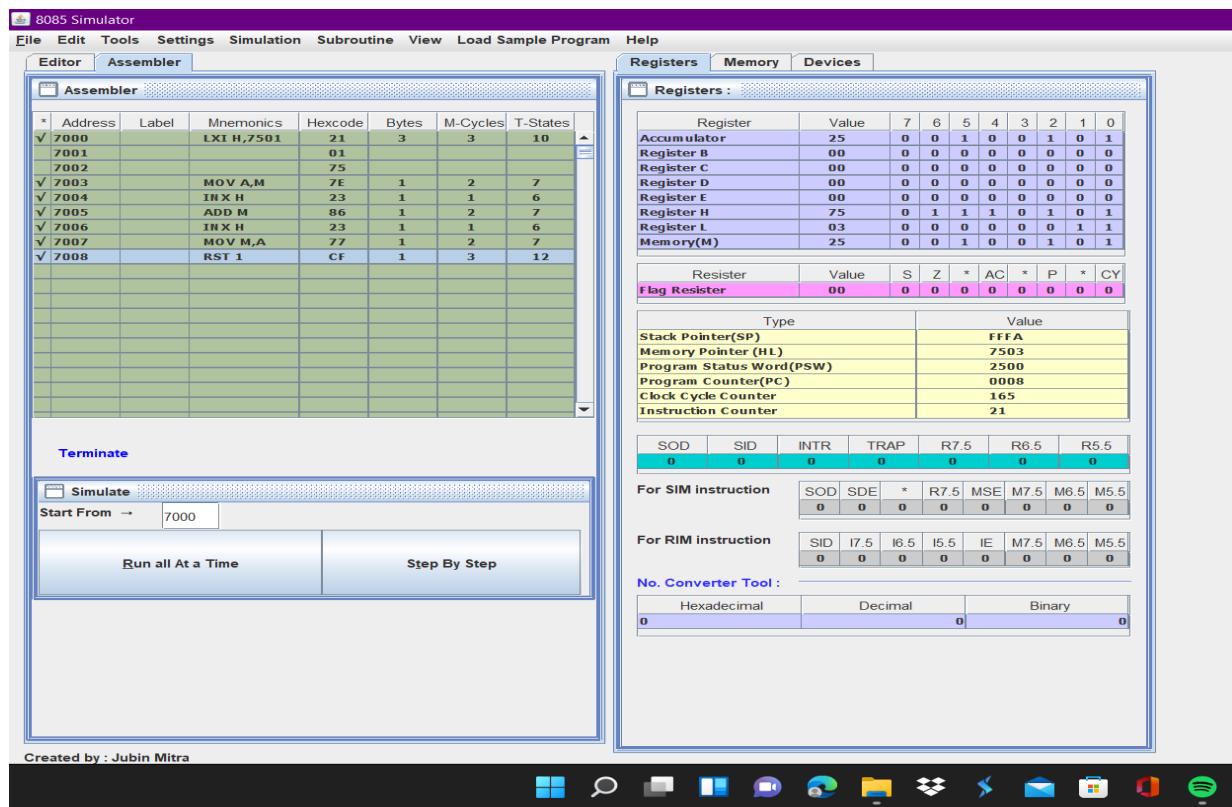

# ORG 7501H      // Store input at the address

# DB 12H, 13H    // Get two 8 bit no in successive location

```

## INPUT & OUTPUT:

## B. To count no of 1's and 0's in a given byte.

### CODE:

```

# ORG 2000H

MVI C,00      // Clear reg.C

MVI D,00      // Clear reg.D

MVI A,0A      // Take number into Accumulator

MVI B,08      // Counter 8 loaded in reg.B

up: RLC      // Rotate left through carry

JNC down      // Jump if CF=0

INR D          // D+1=>D for 1's counter

JMP shift      // Unconditional Jump

down: INR C    // C+1=> C for 0's counter

```

```

shift: DCR B // B-1=> B
JNZ up // True until B=0
RST 1      // Terminate

```

## INPUT & OUTPUT:

The screenshot shows the 8085 Simulator interface. On the left, the **8085 Assembly Language Editor** window displays the following assembly code:

```

// To count no of 1's and 0's in a given byte.
* ORG 2000H
    MVI C,00 // Clear reg C
    MVI D,00 // Clear reg D
    MVI A,0A // Counter 8 loaded in reg B

    UP:   RLC // Rotate left through carry
          JNC DOWN // Jump if CF=0
          INR D // D+1=>D for 1's counter
          JMP SHIFT // Unconditional Jump

    DOWN: INR C // C+1=> C for 0's counter

    SHIFT: DCR B // B-1=> B
            JNZ UP // True until B=0
            RST 1 // Terminate

```

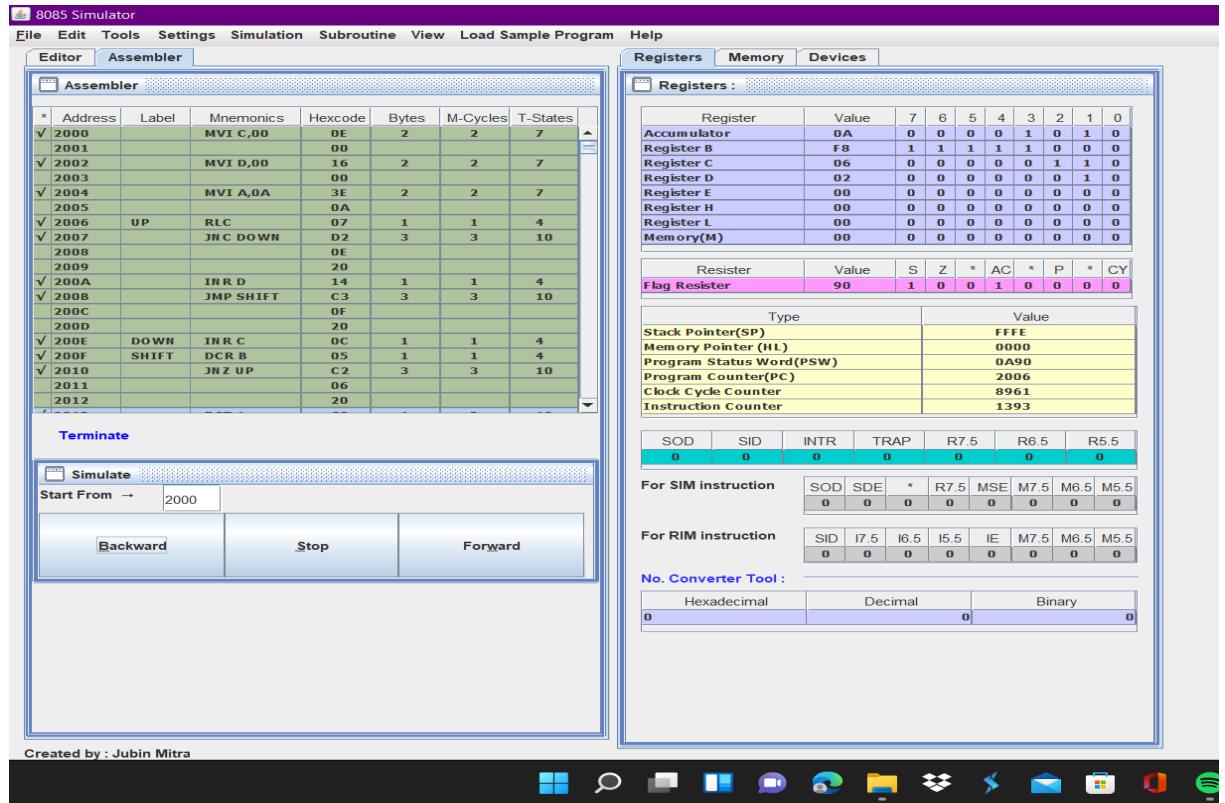

On the right, the **Memory Editor** window shows the memory range from 0000 to FFFF. The memory contents are as follows:

Memory Address	Value
2000	0E
2002	16
2004	3E
2005	0A
2006	07
2007	D2
2008	0E
2009	20
200A	14
200B	C3
200C	0F
200D	20
200E	0C
200F	05
2010	C2
2011	06
2012	20
2013	CF
FFFF	14

At the bottom of the Memory Editor window, there are three radio buttons:

- Show entire memory content
- Show only loaded memory location
- Store directly to specified memory location

The status bar at the bottom of the application window says "Created by : Jubin Mitra".

## C. Division of two 8 bit numbers

( without remainder)

**CODE:**

```
# ORG 7000H
LDA    7501 // [7501]=>A (Divisor)
MOV    B,A // Take divisor in reg,B
LDA    7502 // Take dividend in reg,A
MVI    C,00 // Quotient=00
CMP    B // Compare A to B
JC    down // Jump if carry
up: SUB   B // Dividend-divisor=>A
INR    C // C=C+1
CMP    B // Is dividend < divisor
```

```
JNC up // If not, go back
```

**down:**

```
MOV A,C // C=>A
```

```
STA 7504 // Store Quotient
```

```
RST 1 // Terminate
```

```
# ORG 7501H // Store the inputs at the address
```

```
# DB 02,26 // Get the numbers from successive loc.
```

## INPUT & OUTPUT:

The screenshot shows the 8085 Simulator interface. On the left, the Assembly Language Editor window displays the following code:

```
// Division of two 8 bit numbers
# ORG 7000H
    LDA 7501 // [7501]=>A (Divisor)
    MOV B,A // Take divisor in reg.B
    LDA 7502 // Take dividend in reg.A
    MVI C,00 // Quotient=00
    CMP B // Compare A to B
    JC DOWN // Jump if carry

UP:   SUB B // Dividend-divisor=>A
      INR C // C=C+1
      CMP B // Is dividend < divisor
      JNC UP // If not, go back

DOWN:
    MOV A,C // C=>A
    STA 7504 // Store Quotient
    RST 1 // Terminate

# ORG 7501H // Store the inputs at the address
# DB 02,26 // Get the numbers from successive loc.
```

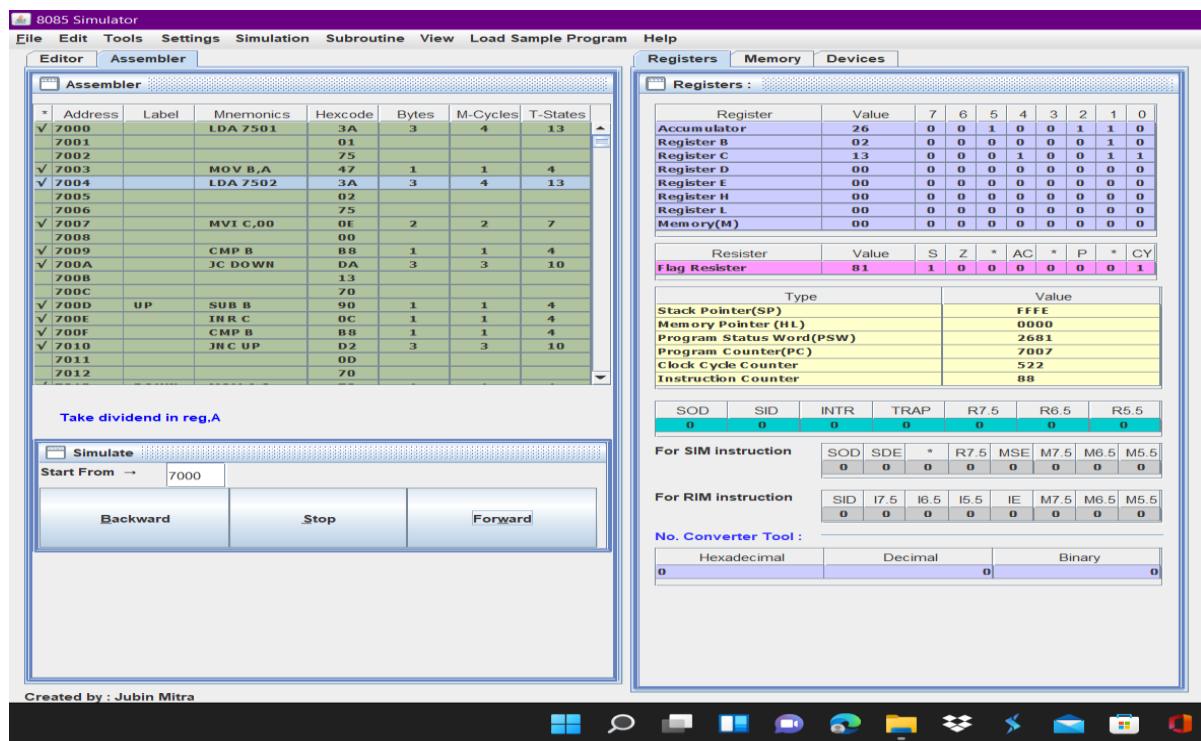

On the right, the Memory Editor window shows the memory dump from address 7000 to FFFF:

Memory Address	Value
7006	75
7007	0E
7009	B8
700A	DA
700B	13
700C	70
700D	90
700E	0C
700F	B8
7010	D2
7011	0D
7012	70
7013	79
7014	32
7015	04
7016	75
7017	CF
7501	02
7502	26
7504	13
FFFE	18
FFFF	70

At the bottom, there are checkboxes for memory display options:

- Show entire memory content
- Show only loaded memory location
- Store directly to specified memory location

Buttons at the bottom left include Autocorrect and Assemble. The status bar at the bottom says "Created by : Jubin Mitra".

( with remainder)

### CODE:

```
# ORG 7000H

LDA    7501 // [7501]=>A (Divisor)

MOV  B,A // Take divisor in reg,B

LDA  7502 // Take dividend in reg,A

MVI  C,00 // Quotient=00

CMP  B // Compare A to B

JC down // Jump if carry

up: SUB  B // Dividend-divisor=>A

INR  C // C=C+1

CMP  B // Is dividend < divisor

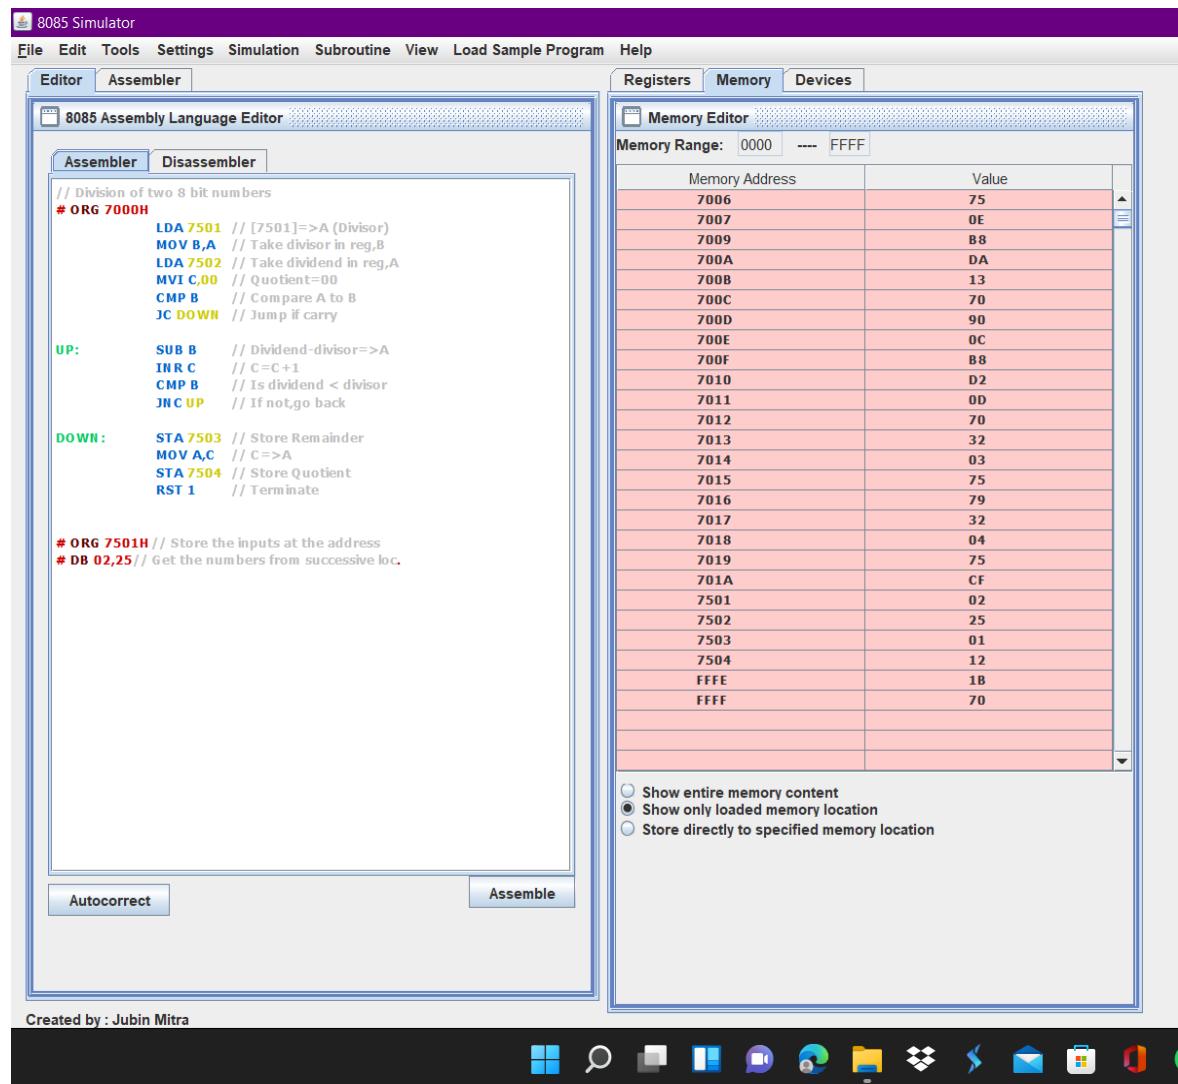

JNC up // If not, go back
```

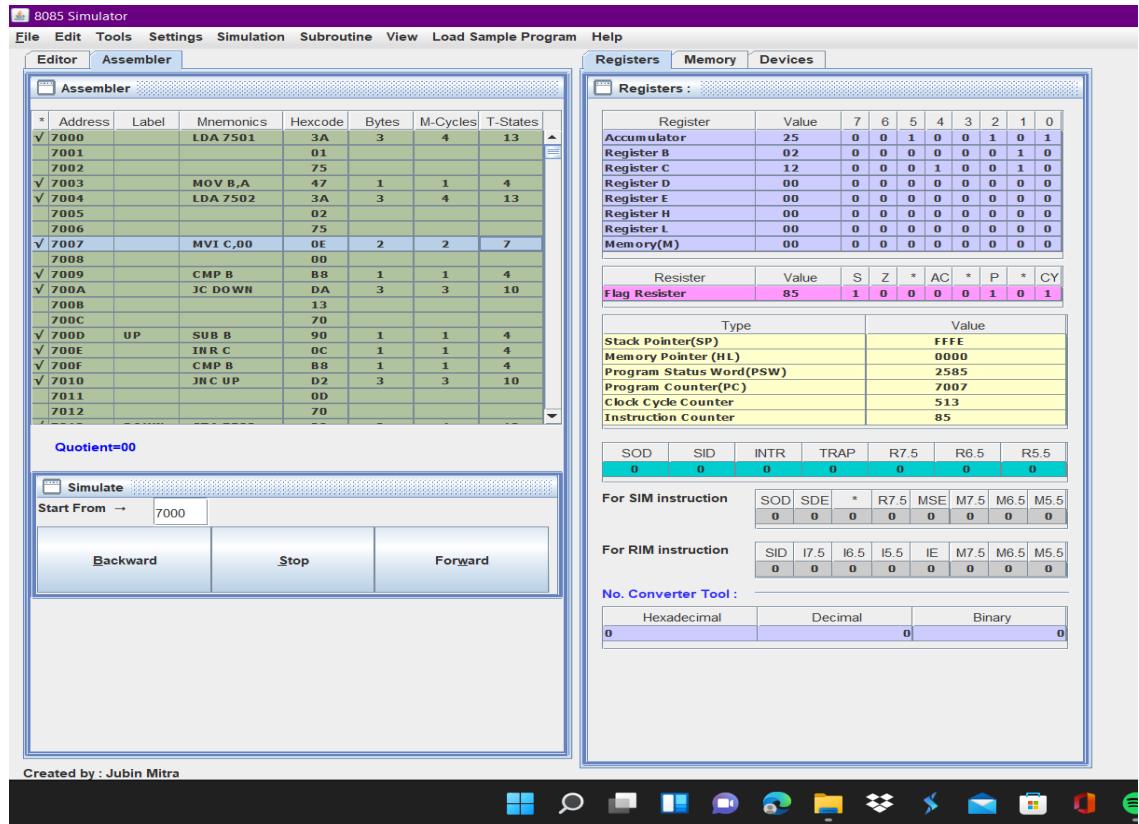

```

down: STA 7503 // Store Remainder
MOV A,C // C=>A
STA 7504 // Store Quotient
RST 1 // Terminate
# ORG 7501H // Store the inputs at the address
# DB 02,25 // Get the numbers from successive loc.

```

## INPUT & OUTPUT:

## D. Move a block of data ( 10 numbers from one memory location to another)

### CODE:

```
// Move a block of data
```

```
# ORG 2000H
```

```
# BEGIN 2000H
```

```
LXI H,3090
```

```
LXI D,30B0
```

```
MOV C,M
```

```
L1:    INX H
```

```
MOV A,M
```

```
STAX D
```

```

INX D
DCR C
JNZ L1
HLT
# ORG 3090H
# DB10 ,05,10,15,20,25,30,35,40,45,50

```

### INPUT & OUTPUT:

The screenshot shows the 8085 Simulator application window. On the left, the **8085 Assembly Language Editor** displays the following assembly code:

```

// Move a block of data
# ORG 2000H
# BEGIN 2000H
    LXI H,3090
    LXI D,3080
    MOV C,M

L1:   INX H
      MOV A,M
      STAX D
      INX D
      DCR C
      JNZ L1
      HLT

# ORG 3090H
# DB10 ,05,10,15,20,25,30,35,40,45,50

```

On the right, the **Registers** tab shows the initial state of the registers:

Register	Value	7	6	5	4	3	2	1	0
Accumulator	00	0	0	0	0	0	0	0	0
Register B	00	0	0	0	0	0	0	0	0
Register C	00	0	0	0	0	0	0	0	0
Register D	30	0	0	1	1	0	0	0	0
Register E	C0	1	1	0	0	0	0	0	0
Register H	30	0	0	1	1	0	0	0	0
Register L	A0	1	0	1	0	0	0	0	0
Memory(M)	00	0	0	0	0	0	0	0	0

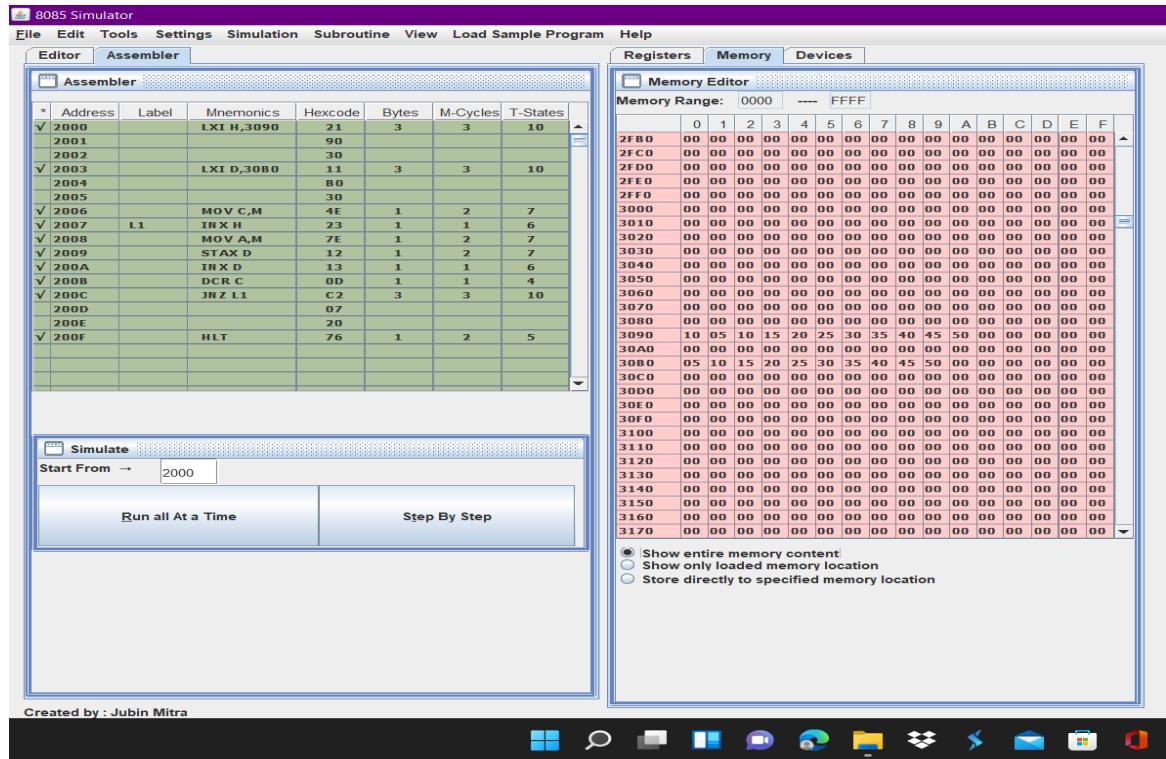

The **Flag Register** is also shown:

Resister	Value	S	Z	*	AC	*	P	*	CY
Flag Register	54	0	1	0	1	0	1	0	0

The **Memory Dump** section shows the memory starting at address 2000H:

Type	Value
Stack Pointer(SP)	0000
Memory Pointer (HL)	30A0
Program Status Word(PSW)	0054
Program Counter(PC)	200F
Clock Cycle Counter	669
Instruction Counter	100

Below the memory dump are controls for **SIM** and **RIM** instructions, and a converter tool for Hexadecimal, Decimal, and Binary values.

**Arrange random numbers in ascending as well as descending order.**

### CODE:

```
// Arrange random numbers in ascending
# ORG 2000H
    LDA F100 // Load count from F100 to Acc.
    DCR A    // Decrement A by 1
    MOV C,A  // A=>C
    MOV B,C  // C=>B
    LXI H,F200 // HL <= F200
    UP:   MOV A,M // [HL] =>A
          INX H    // HL+1=>HL
          CMP M    // Compare reg M to A
          JC DOWN // If A< M jump condition is true
```

```

MOV D,M // M=> D

MOV M,A // A=>M

DCX H // HL-1 => HL

MOV M,D // D<=M

INX H // HL+1=>HL

DOWN: DCR B // Decrement b by 1

JNZ UP // Jump until B=0

DCR C // Decrement C by 1

JNZ 2005 // Jump until C=0

RST 1 // Terminate

# ORG F100H// Store number count at the address

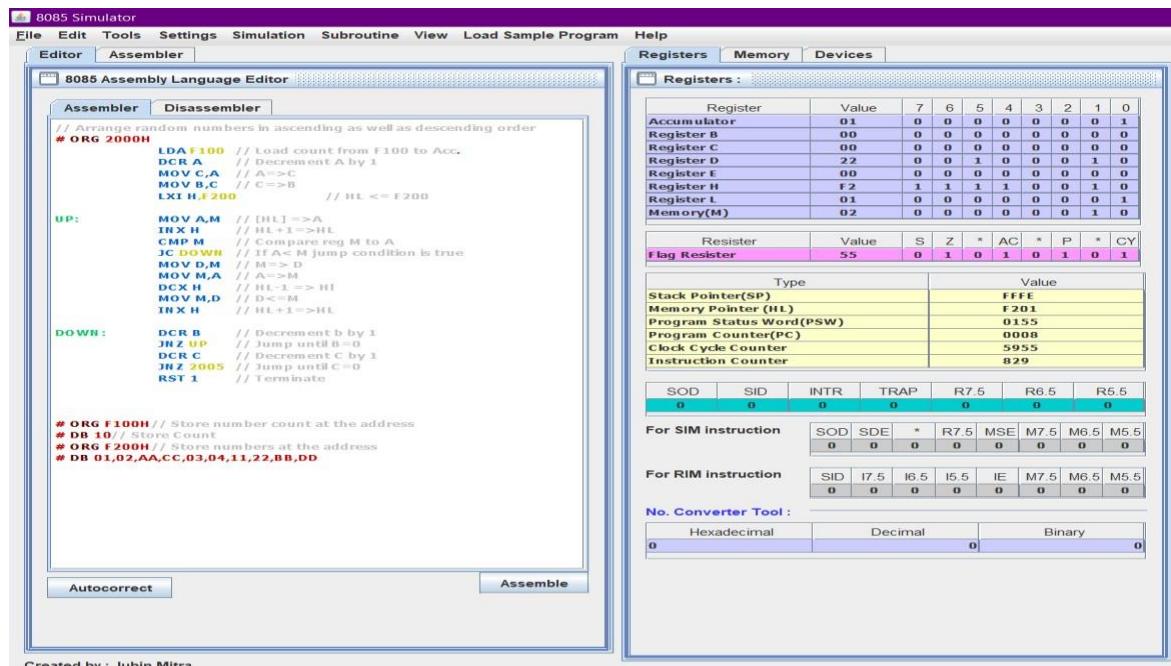

# DB 10// Store Count

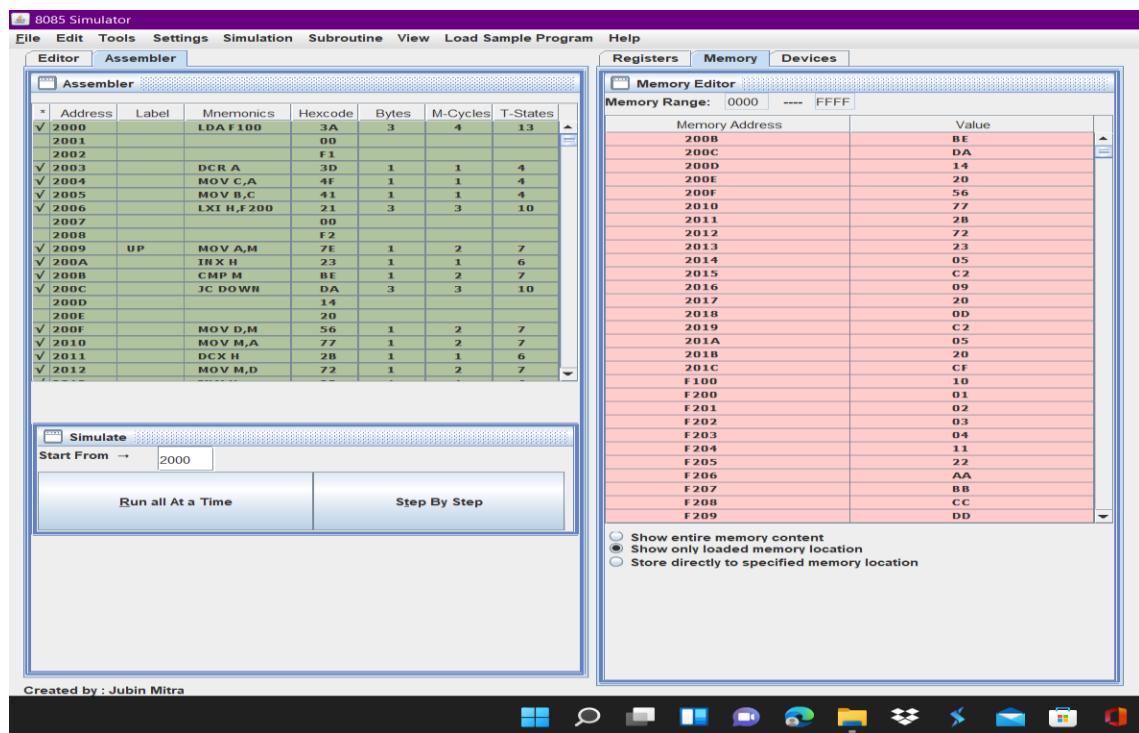

# ORG F200H// Store numbers at the address

# DB 01,02,AA,CC,03,04,11,22,BB,DD

```

## INPUT & OUTPUT:

// Arrange random numbers in descending order

# ORG 2000H

LDA F100 // Load count from F100 to Acc.

DCR A // Decrement A by 1

MOV C,A // A=>C

MOV B,C // C=>B

LXI H,F200 // HL <= F200

UP: MOV A,M // [HL] =>A

INX H // HL+1=>HL

CMP M // Compare reg M to A

JNC DOWN// If A< M jump condition is true

MOV D,M // M=> D

MOV M,A // A=>M

```

DCX H      // HL-1 => HI

MOV M,D // D<=M

INX H      // HL+1=>HL

DOWN: DCR B      // Decrement b by 1

JNZ UP      // Jump until B=0

DCR C      // Decrement C by 1

JNZ 2005    // Jump until C=0

RST 1      // Terminate

# ORG F100H// Store number count at the address

# DB 01,02,AA,CC,03,04,11,22,BB,DD

```

## INPUT & OUTPUT:

## F. Obtain Fibonacci Series.

### CODE:

//Fibonacci Series.

MVI A,00H

STA C04FH

MVI A,01H

STA C050H

MVI D,08

LXI H,C04FH

BACK: MOV A,M

INX H

ADD M

INX H

MOV M,A

DCR D

DCX H

JNZ BACK

HLT

## INPUT & OUTPUT:

The screenshot shows the 8085 Simulator software interface. The assembly code window contains the following instructions:

```
//Fibonacci Series.  
MVI A,00H  
STA C04FH  
MVI A,01H  
STA C050H  
MVI D,08  
LXI H,C04FH  
  
BACK: MOV A,M  
INX H  
ADD M  
INX H  
MOV M,A  
DCR D  
DCX H  
JNZ BACK  
HLT
```

The Registers window displays the following register values:

Register	Value	7	6	5	4	3	2	1	0
Accumulator	22	0	0	1	0	0	0	1	0
Register B	00	0	0	0	0	0	0	0	0
Register C	00	0	0	0	0	0	0	0	0
Register D	00	0	0	0	0	0	0	0	0
Register E	00	0	0	0	0	0	0	0	0
Register H	C0	1	1	0	0	0	0	0	0
Register L	57	0	1	0	1	0	1	1	1
Memory(M)	15	0	0	0	1	0	1	0	1

Resister	Value	S	Z	*	AC	*	P	*	CY
Flag Register	54	0	1	0	1	0	1	0	0

Type	Value
Stack Pointer(SP)	0000
Memory Pointer (HL)	C057
Program Status Word(PSW)	2254
Program Counter(PC)	0019
Clock Cycle Counter	483
Instruction Counter	71

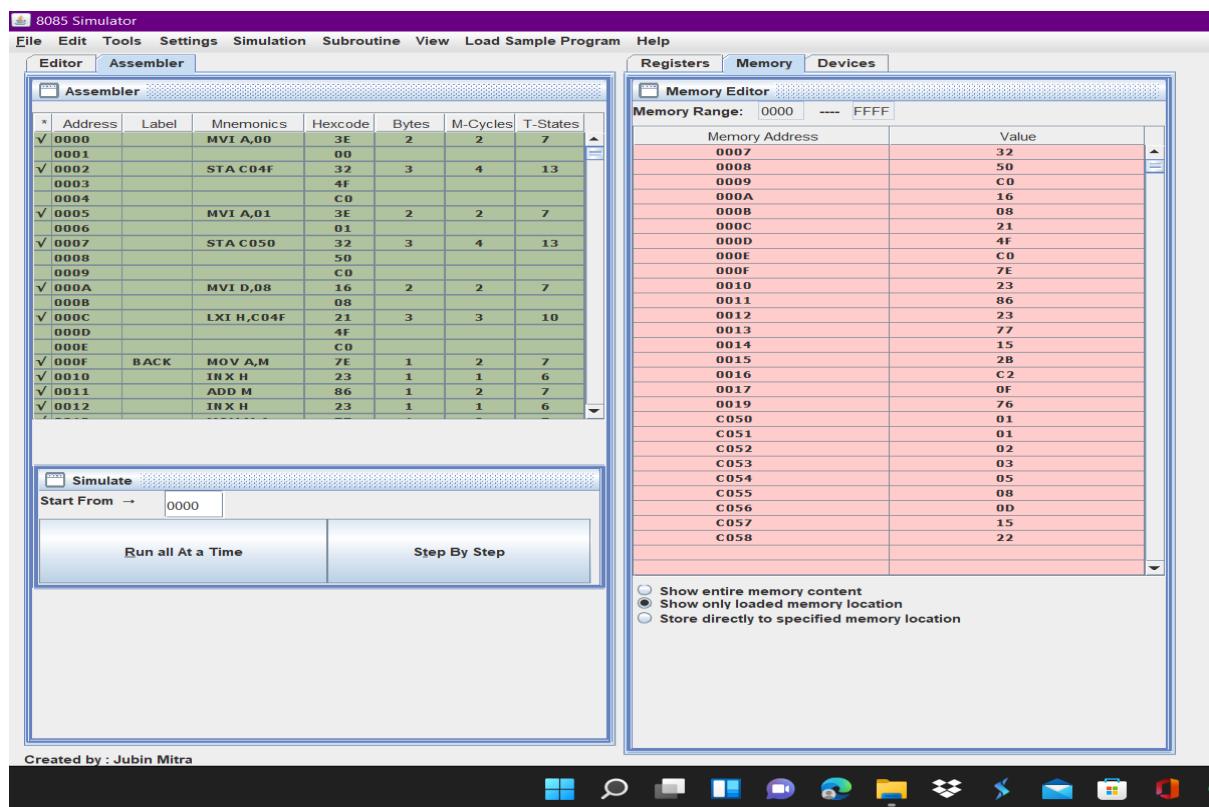

SOD	SID	INTR	TRAP	R7.5	R6.5	R5.5
0	0	0	0	0	0	0

For SIM instruction	SOD	SDE	*	R7.5	MSE	M7.5	M6.5	M5.5
	0	0	0	0	0	0	0	0

For RIM instruction	SID	I7.5	I6.5	I5.5	IE	M7.5	M6.5	M5.5
	0	0	0	0	0	0	0	0

No. Converter Tool :		
Hexadecimal	Decimal	Binary
0	0	0

At the bottom left, it says "Created by : Jubin Mitra". The taskbar at the bottom of the screen shows various application icons.

## G. Obtain factorial of a number.

### CODE:

```
// Factorial of given no

#ORG 1000

START:

    LXI H,2000// Pointing at memory location of input number

    MOV B,M // using register B as first counter

    MVI D,01

LOOP1: CALL FACT      // calling the subroutine

    DCR B      // decrement the counter B

    JNZ LOOP1 // loop until B is not equal to 0

    INX H      // increment pointer to next element
```

MOV M,D // Move value of D to memory

HLT // halt the entire process

FACT: MOV C,B // using register C as second counter

MVI A,00 // clear the contents of accumulator

LOOP2: ADD D // add value in D to accumulator

DCR C // decrement counter C

JNZ LOOP2 // loop until B is not equal to zero

MOV D,A // move value in accumulator to D

RET // return to main function

#ORG 2000

#DB 06

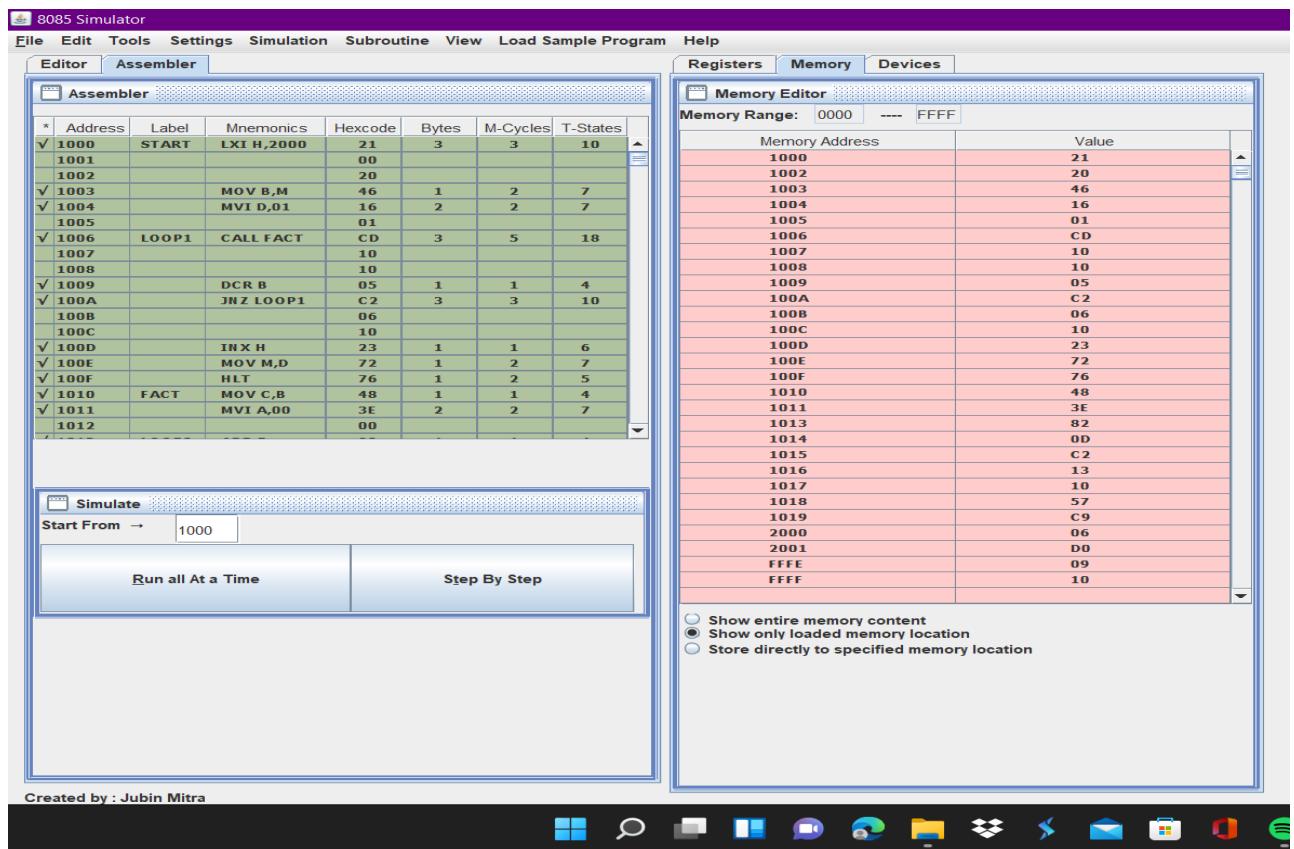

## INPUT & OUTPUT:

The screenshot shows the 8085 Simulator interface with the following details:

- Assembler Tab:** Displays the assembly language code for calculating Factorial.
- Registers Tab:** Shows the state of various registers:
  - Accumulator: 00 (Value: 1 1 0 1 0 0 0 0)
  - Register B: 00 (Value: 0 0 0 0 0 0 0 0)
  - Register C: 00 (Value: 0 0 0 0 0 0 0 0)
  - Register D: 00 (Value: 1 1 0 1 0 0 0 0)
  - Register E: 00 (Value: 0 0 0 0 0 0 0 0)
  - Register H: 20 (Value: 0 0 1 0 0 0 0 0)
  - Register L: 01 (Value: 0 0 0 0 0 0 0 1)
  - Memory(M): 00 (Value: 1 1 0 1 0 0 0 0)
- Flag Register:** Shows the flag register values: Resister 54, S=0, Z=1, AC=0, P=1, CY=0.
- Memory Dump:** Shows the memory dump for addresses 0000 to 2001.

Type	Value
Stack Pointer(SP)	0000
Memory Pointer (HL)	2001
Program Status Word(PSW)	0054
Program Counter(PC)	100F
Clock Cycle Counter	741
Instruction Counter	111
- Control Registers:** Shows the values for SOD, SID, INTR, TRAP, R7.5, R6.5, and R5.5.
- For SIM instruction:** Shows the values for SOD, SDE, R7.5, MSE, M7.5, M6.5, and M5.5.
- For RIM instruction:** Shows the values for SID, I7.5, I6.5, I5.5, IE, M7.5, M6.5, and M5.5.
- No. Converter Tool:** Converts between Hexadecimal, Decimal, and Binary. Both fields show 0.

At the bottom, it says "Created by : Jubin Mitra" and shows a taskbar with various icons.

## RESULTS:

TOPIC	INPUT	OUTPUT
Addition of two 8-bit no.	<b>7501=12H , 7502=13H</b>	<b>7503=25H</b>
Count no of 1's & 0's in give byte	<b>0AH</b>	<b>0=06, 1=02</b>
Division of two 8-bit no (without remainder) (with remainder)	<b>7501=02H, 7502=26H</b> <b>7501=02 , 7502=25H</b>	<b>7504= 13H</b> <b>7503=01H, 7504=12H</b>

Move block of Data	<b>3090</b> <b>onward=05,10,15,20,25,30,35,40,45,50</b>	<b>30B0 onward=</b> <b>05,10,15,20,25,30,35,40,45,50</b>

Fibonacci series	<b>C050H=01H</b>	<b>C050H Onward=</b> <b>01,01,02,03,05,08,0D</b>
Factorial of given no	<b>2000=06H</b>	<b>2001=D0</b>

### Conclusion:

Hence, we have performed assembly language for 8085 Processor by using virtual lab simulator of 8bit microprocessor 8085.

## **EXPERIMENT NO. 2**

**Aim:** Write and execute the program to blink LED using 8051 microcontrollers, generate four random patterns on LED.

**Theory:** 8051 microcontrollers is designed by Intel in 1981. It is an 8-bit microcontroller. It is built with 40 pins DIP (dual inline package), 4kb of ROM storage and 128 bytes of RAM storage, 2 16-bit timers. It consists of are four parallel 8-bit ports, which are programmable as well as addressable as per the requirement. An on-chip crystal oscillator is integrated in the microcontroller having crystal frequency of 12 MHz

The microcontroller is used in-

- Television
- Washing Machines
- Telephones
- Other Electronic gadget

**LED interfacing with 8051 microcontroller:** A microcontroller, being an integrated circuit with a processor, contains support devices like program memory, data memory, I/O ports and serial communication interface integrated together. Since all the required support devices are available with the microcontroller, external interfacing of devices is not required. One of the most popular microcontrollers is Intel 8051. It belongs to the MCS-51 family of Intel microcontrollers. Many companies later adopted the MCS-51 core to develop their own microcontrollers and all these devices could be operated with the MCS-51 instruction sets. The basic difference between these devices is in the size of the memory or in the presence of an ADC or DAC.

The main principle of this circuit is to interface LEDs to the 8051 family micro controller. Commonly, used LEDs will have voltage drop of 1.7v and current of 10mA to glow at full intensity. This is applied through the output pin of the micro controller.

**Interface the Led with 8051 microcontroller in PROTEUS software and insert the screen shot of the same. Write the C program in KEIL and include the screen shot of program as well as output.**

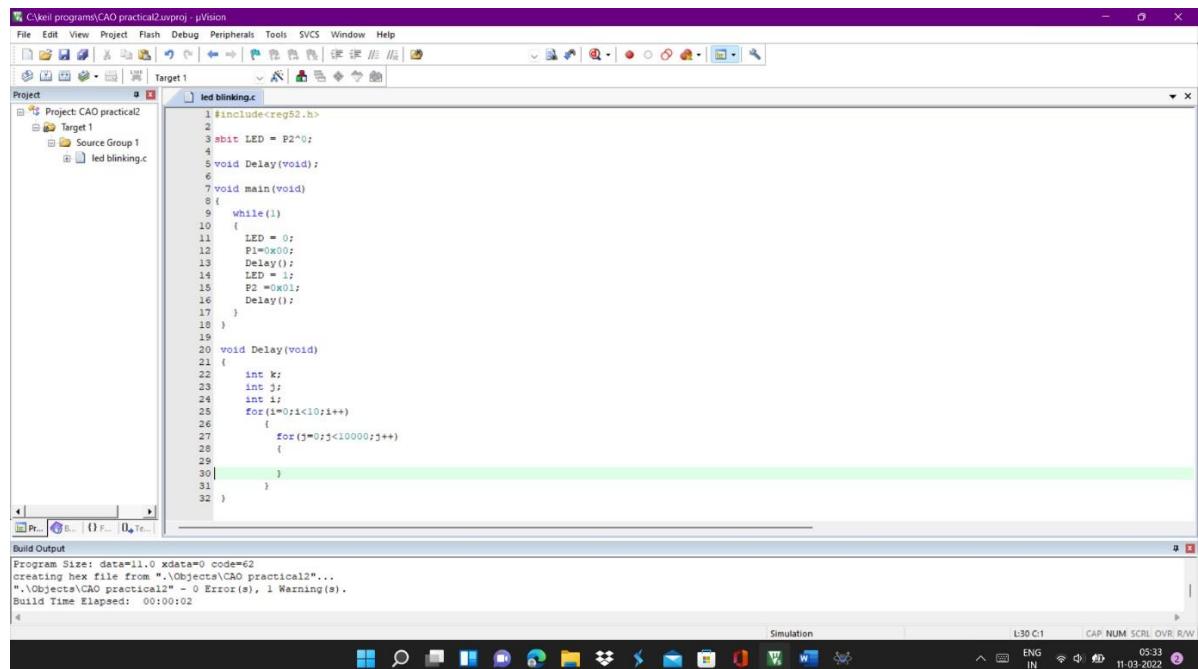

- **Blinking of single LED:**

## Code:

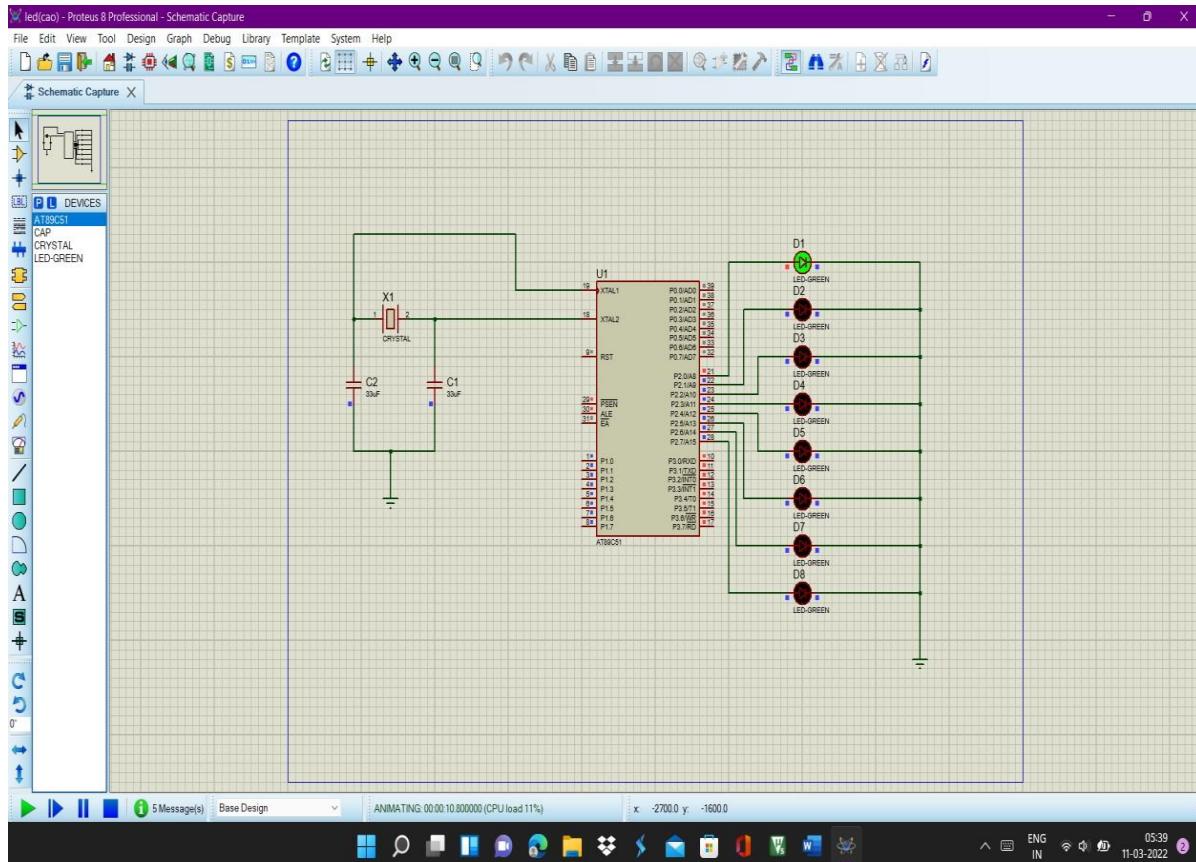

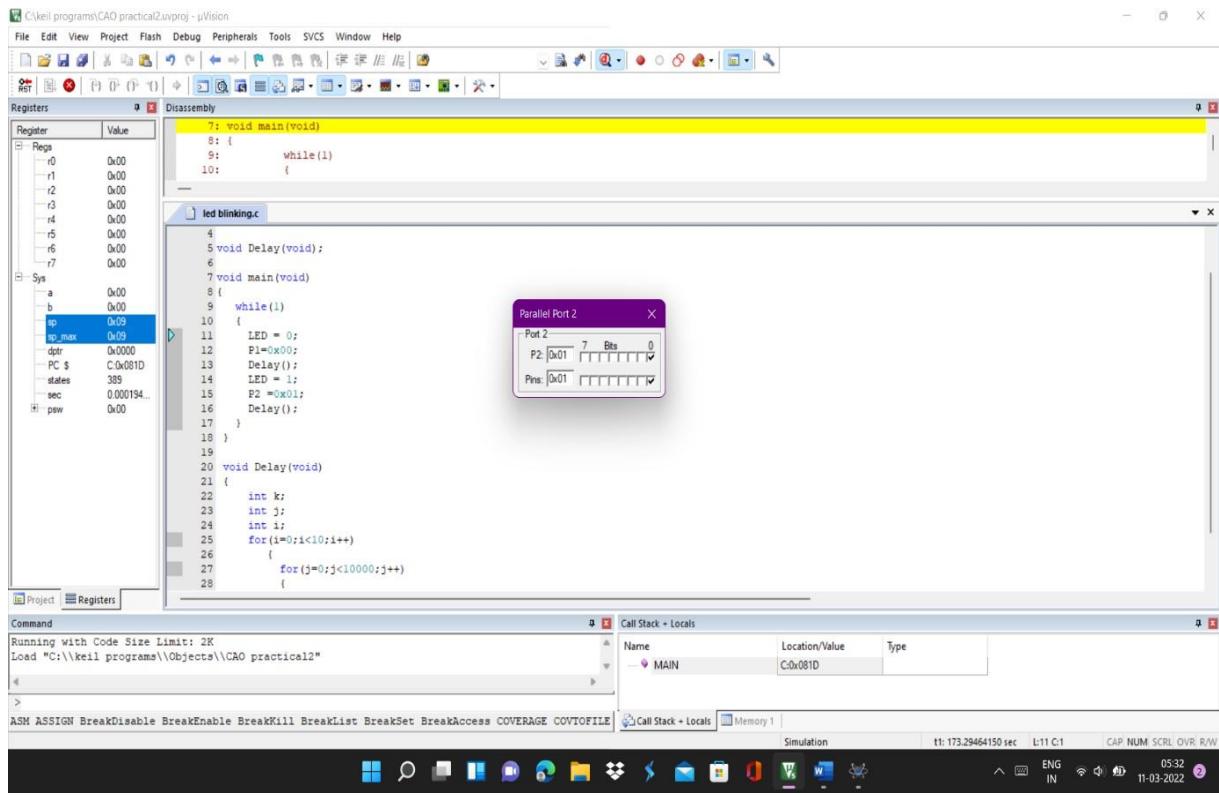

```
#include<reg52.h>
sbit LED = P2^0;
void Delay(void);
void main(void)
{
    while(1)
    {
        LED = 0;
        P1=0x00;
        Delay();
        LED = 1;
        P2 =0x01;
        Delay();
    }
}

void Delay(void)
{
    int k;
    int j;
    int i;
    for(i=0;i<10;i++)
    {
        for(j=0;j<10000;j++)
        {

        }
    }
}
```

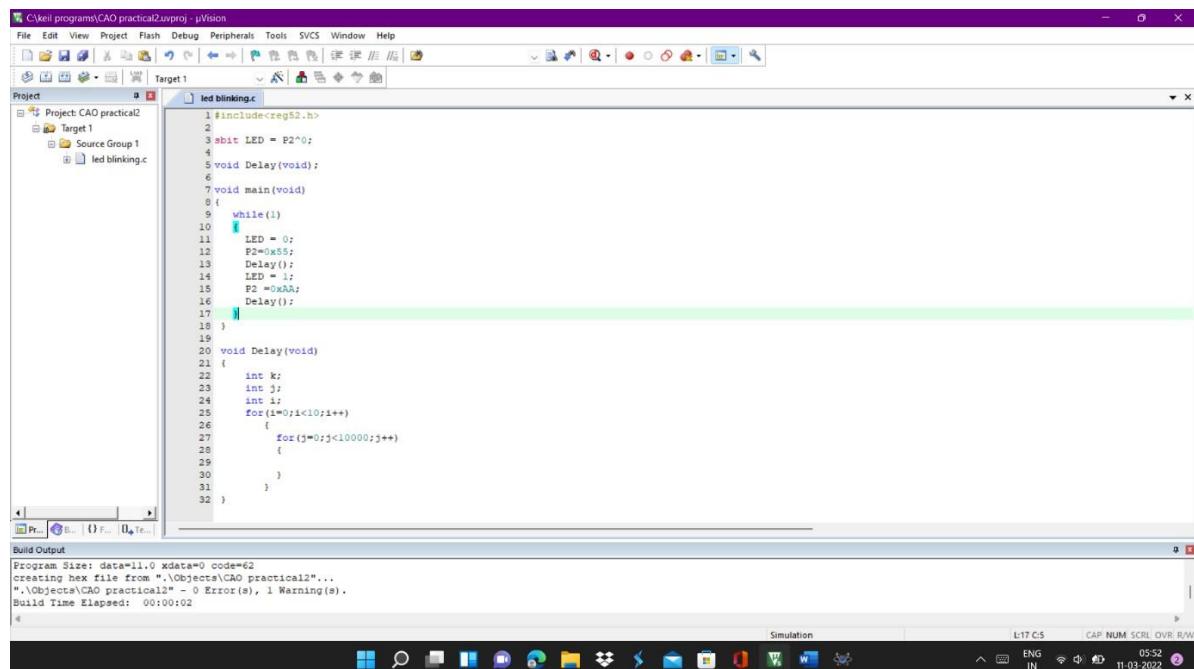

## Output:

- Blinking of LED alternatively

## Code:

```
#include<reg52.h>
sbit LED = P2^0;
void Delay(void);
void main(void)
{
    while(1)
    {
        LED = 0;
        P1=0x55;
        Delay();
        LED = 1;
        P2 =0xAA;
        Delay();
    }
}
void Delay(void)
{
    int k;
    int j;
    int i;
    for(i=0;i<10;i++)
    {
        for(j=0;j<10000;j++)
        {

**Conclusion:** Here, we have performed the blinking of LEDs in using 8051 Microcontroller.

# **EXPERIMENT NO. 3**

**Aim:** Write and Execute a program for generation of Square, Rectangular, Sine, Cosine, Sawtooth and triangular waveform for 8051.

**Theory:** To generate the various types of waveforms like sine, cosine, sawtooth, triangular and square we have to interface Digital to Analog converter (DAC) with 8051 microcontrollers.

## **1. Square wave**

### **Code:**

```
//square wave generation
#include<REG51.h>
void fordelay();
void main()
{
P2 = 0x00;
while(1)
{
P2 = 0xFF;
fordelay();
P2 = 0x00;
fordelay();
}
}
void fordelay()
{
long i=0;
for(i=0;i<=5000;i++)
{}
```

## Output :

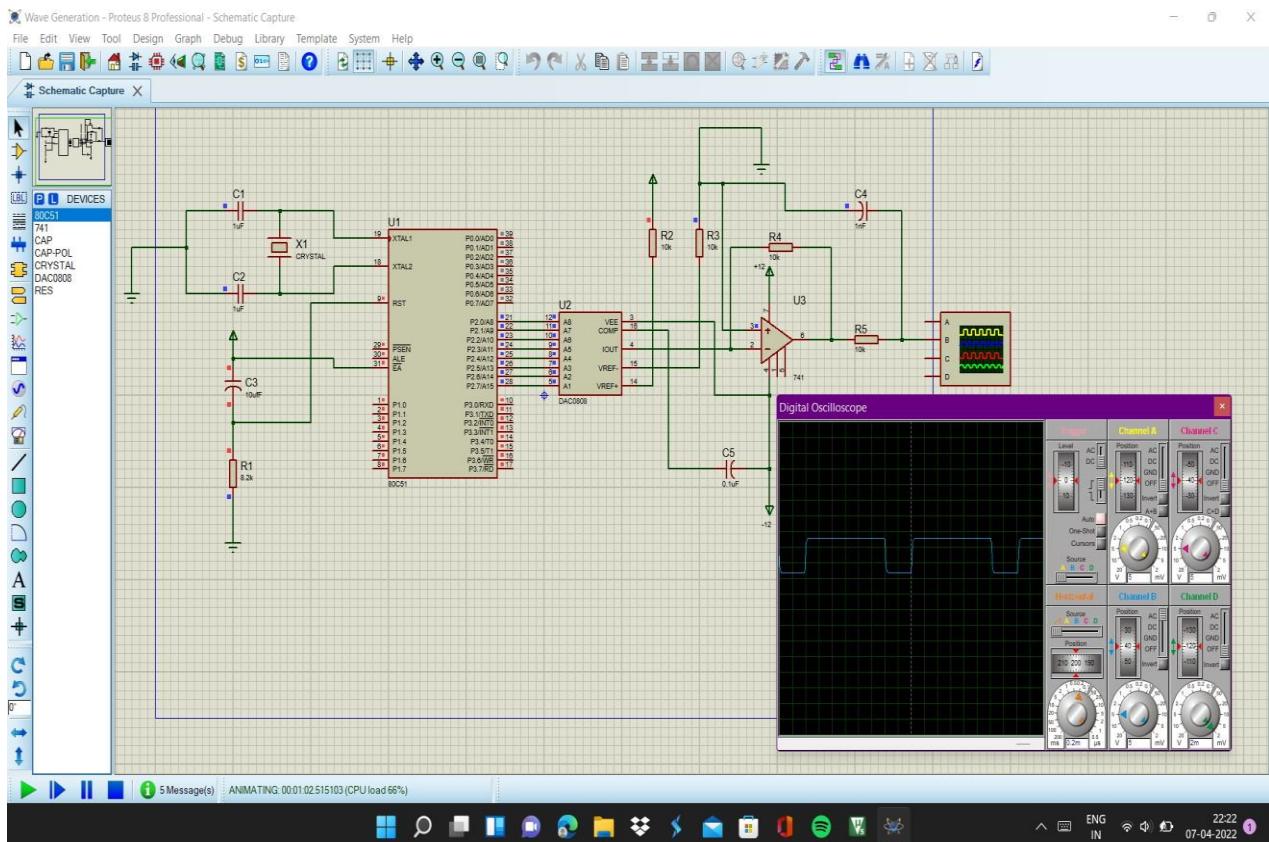

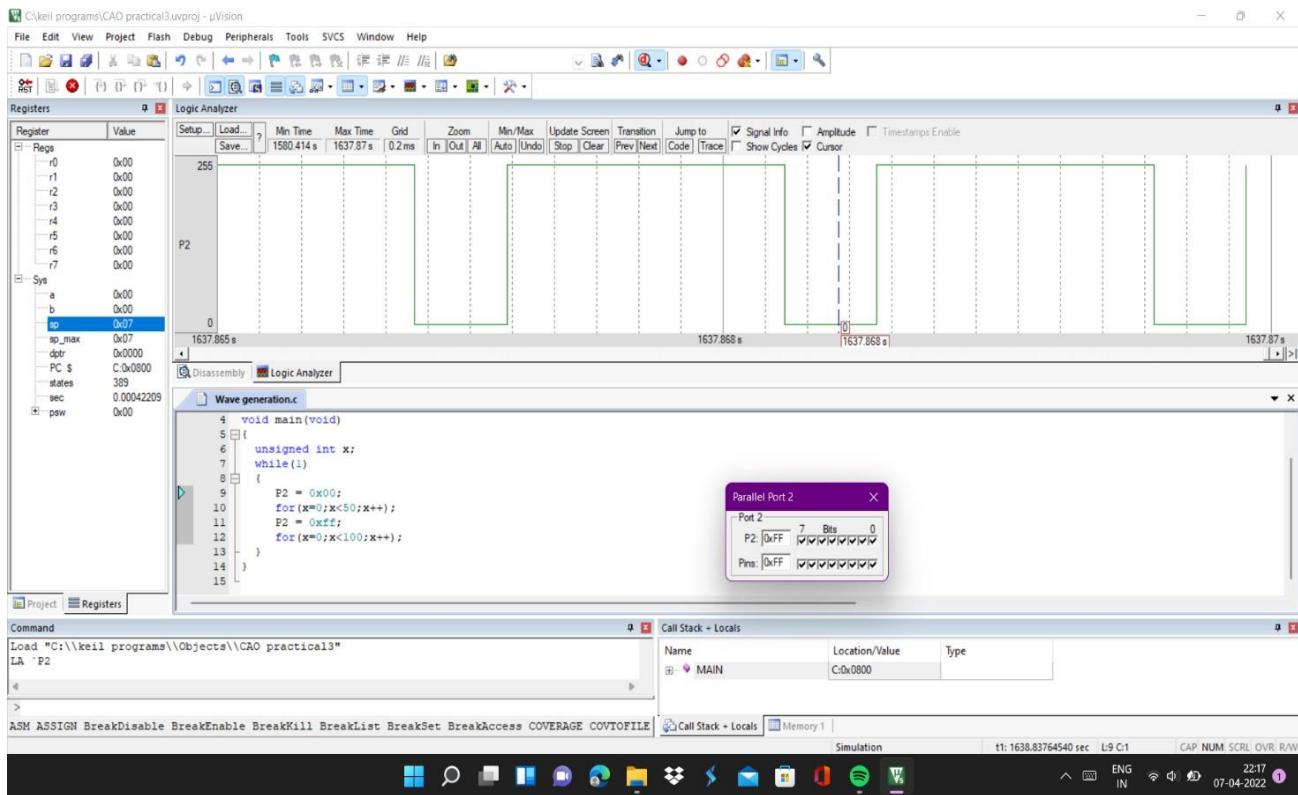

## 2.Rectangular wave:

### Code:

```
//rectangular wave generation
#include<REG51.h>
void main(void)
{
    unsigned int x;
    while(1)
    {
        P2 = 0x00;
        for(x=0;x<50;x++);
        P2 = 0xFF;
        for(x=0;x<100;x++);
    }
}
```

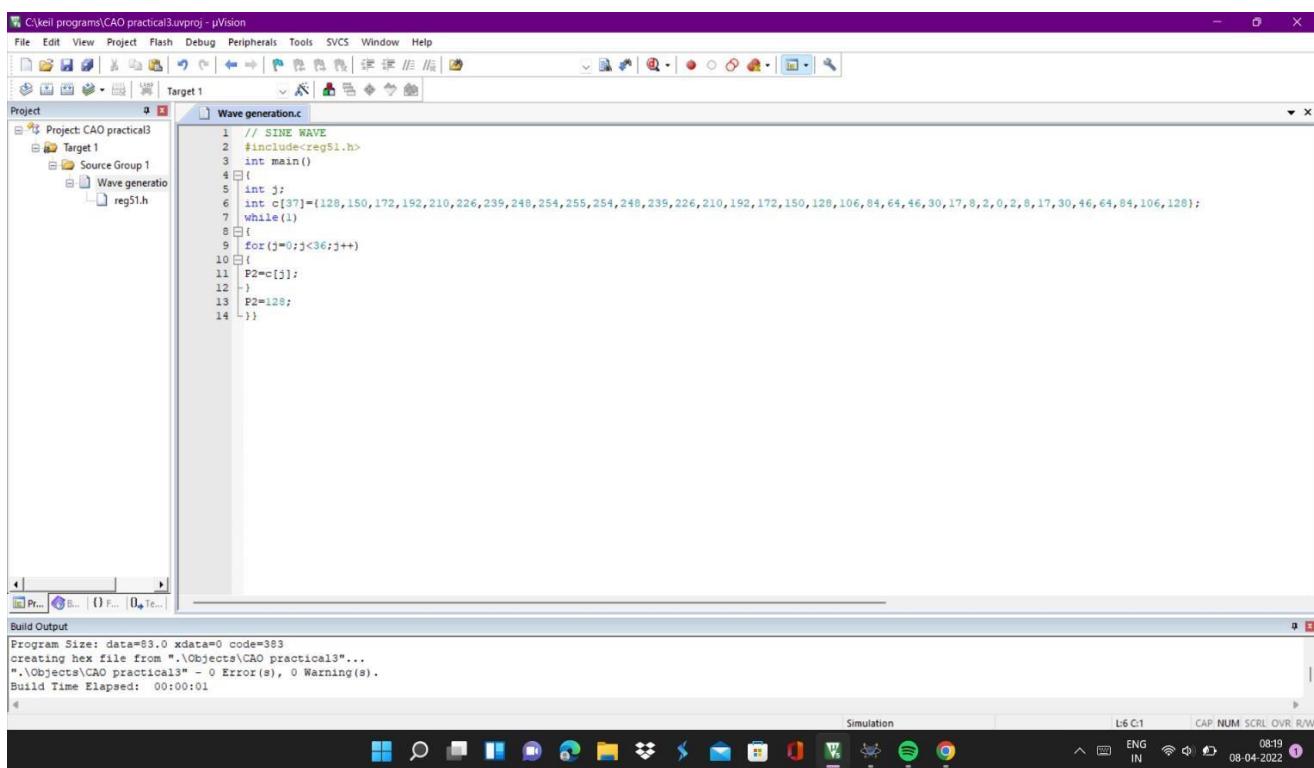

## Output:

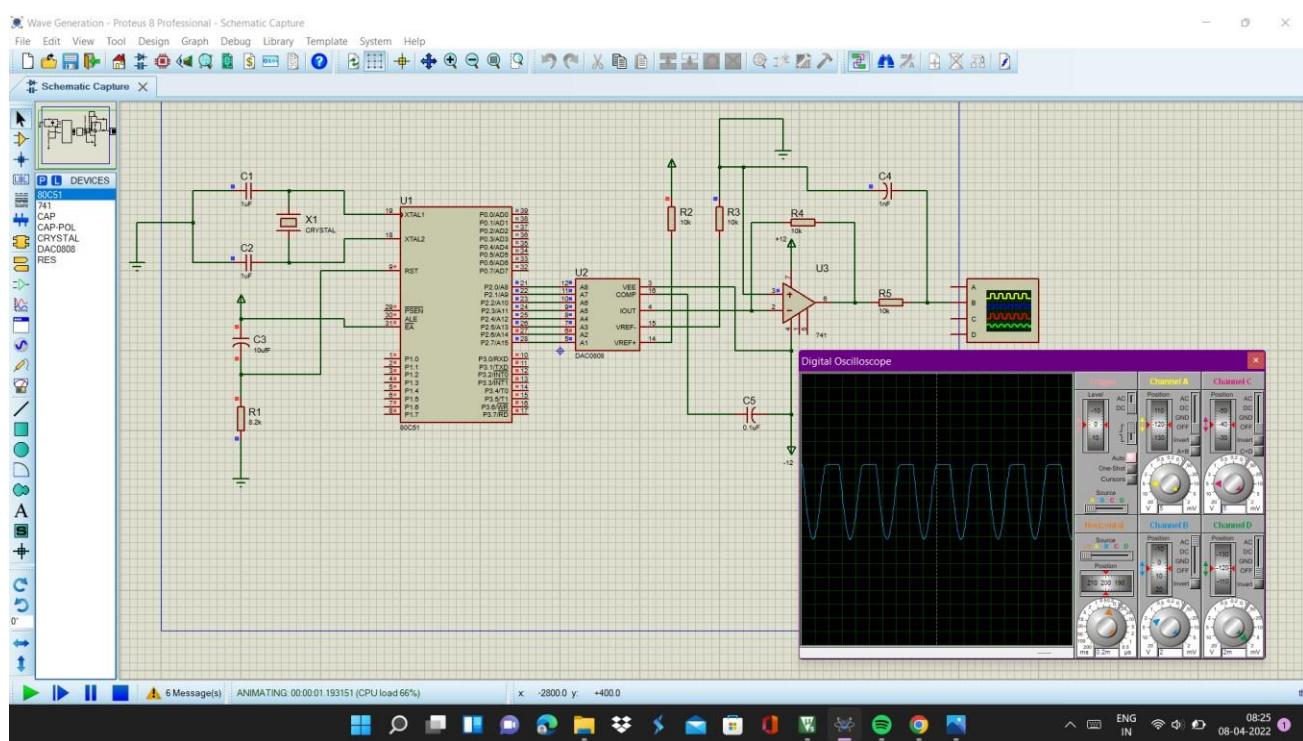

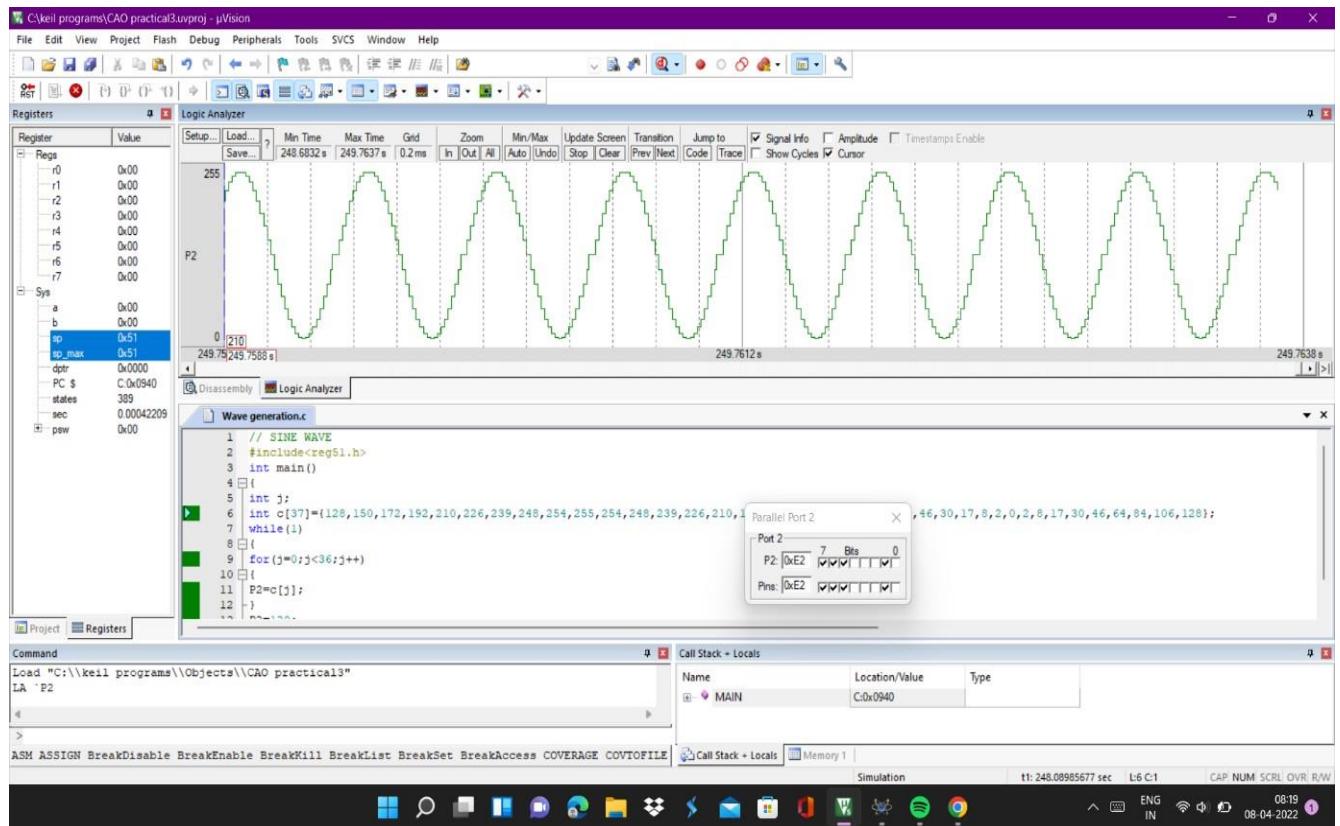

### 3.Sine wave

```
//sine wave generation
#include<reg51.h>
int main()
{
    int j;
    int
c[37]={128,150,172,192,210,226,239,248,254,255,254,248,239,226,210,192,172,150
,128,106,84,64,46,30,17,8,2,0,2,8,17,30,46,64,84,106,128};
while(1)
{
    for(j=0;j<36;j++)
    {
        P2=c[j];
    }
    P2=128;
}}
```

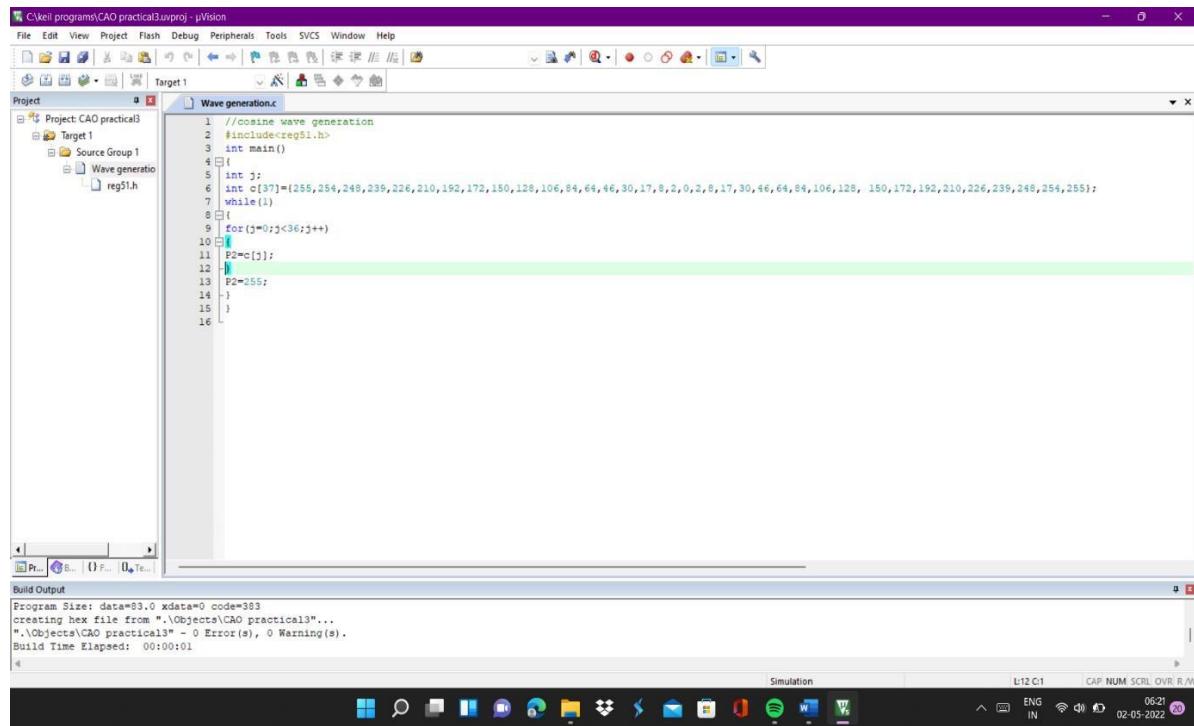

## Output:

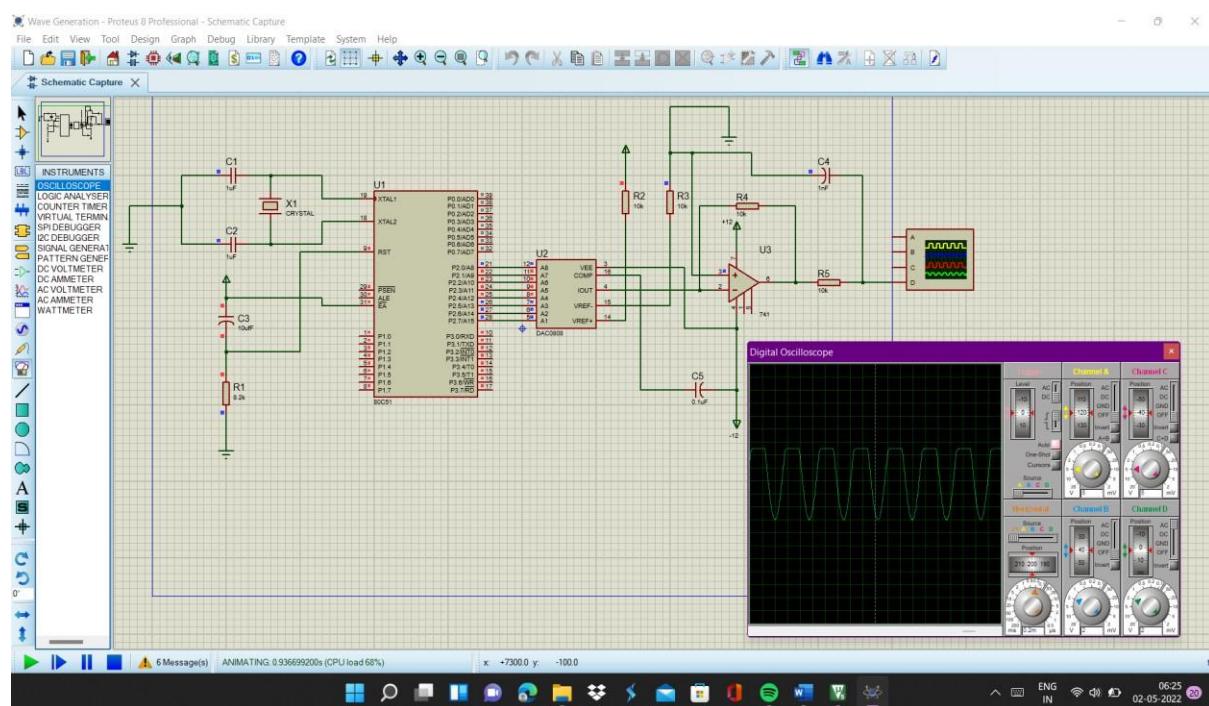

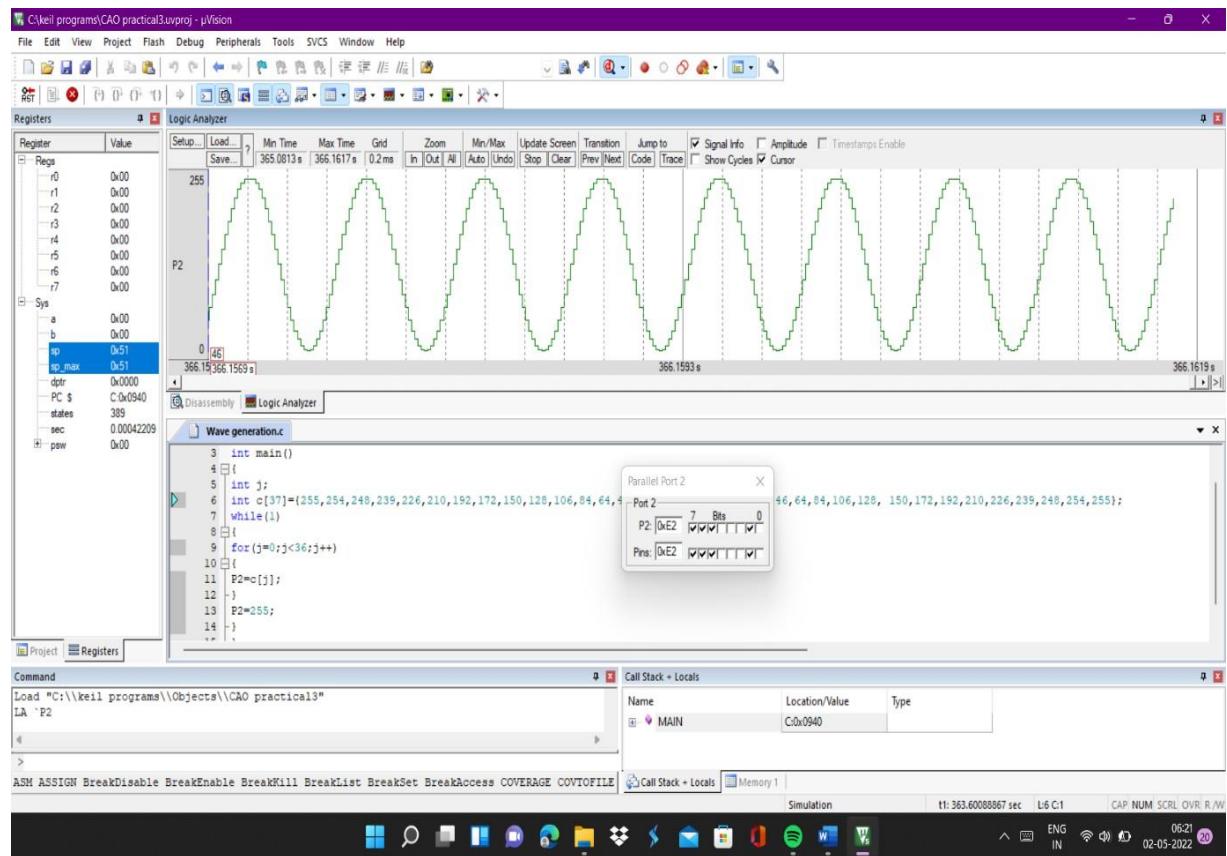

## 4.Cosine wave :

### Code:

```
//cosine wave generation
#include<reg51.h>
int main()
{
    int j;
    int
c[37]={255,254,248,239,226,210,192,172,150,128,106,84,64,46,30,17,8,2,0,2,8,17,3
0,46,64,84,106,128, 150,172,192,210,226,239,248,254,255};
while(1)
{
    for(j=0;j<36;j++)
    {
        P2=c[j];
    }
    P2=255;
}}
```

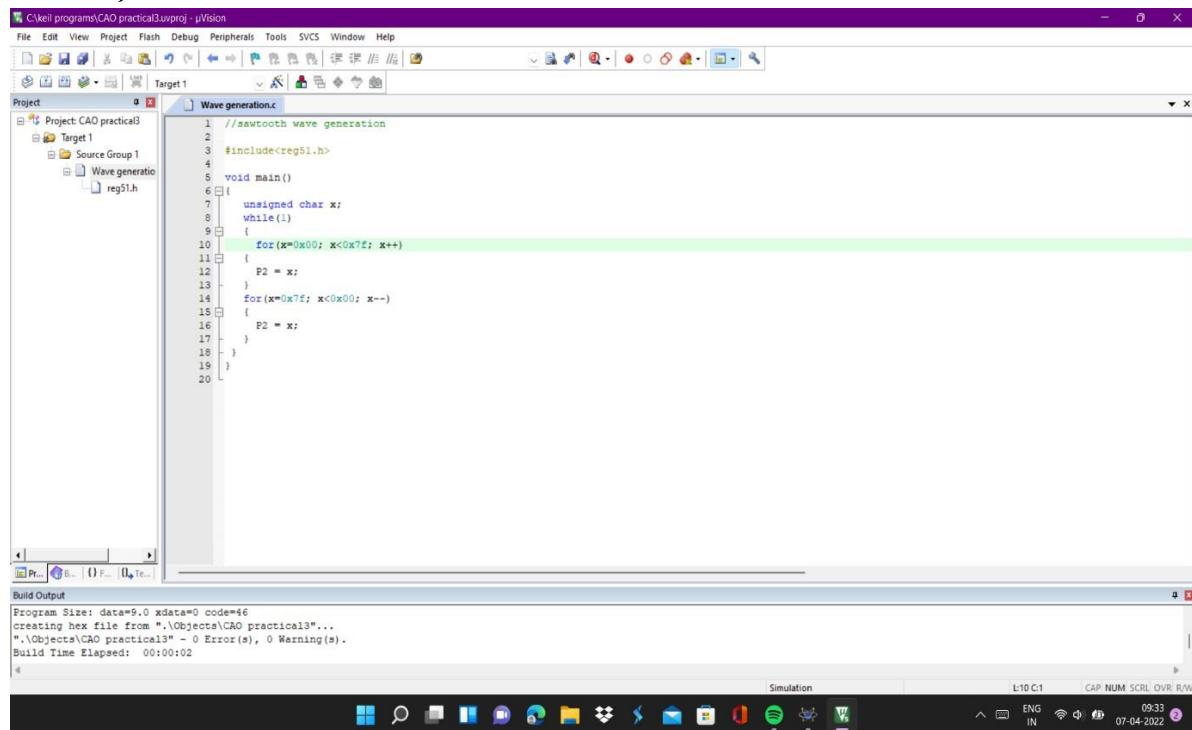

## Output:

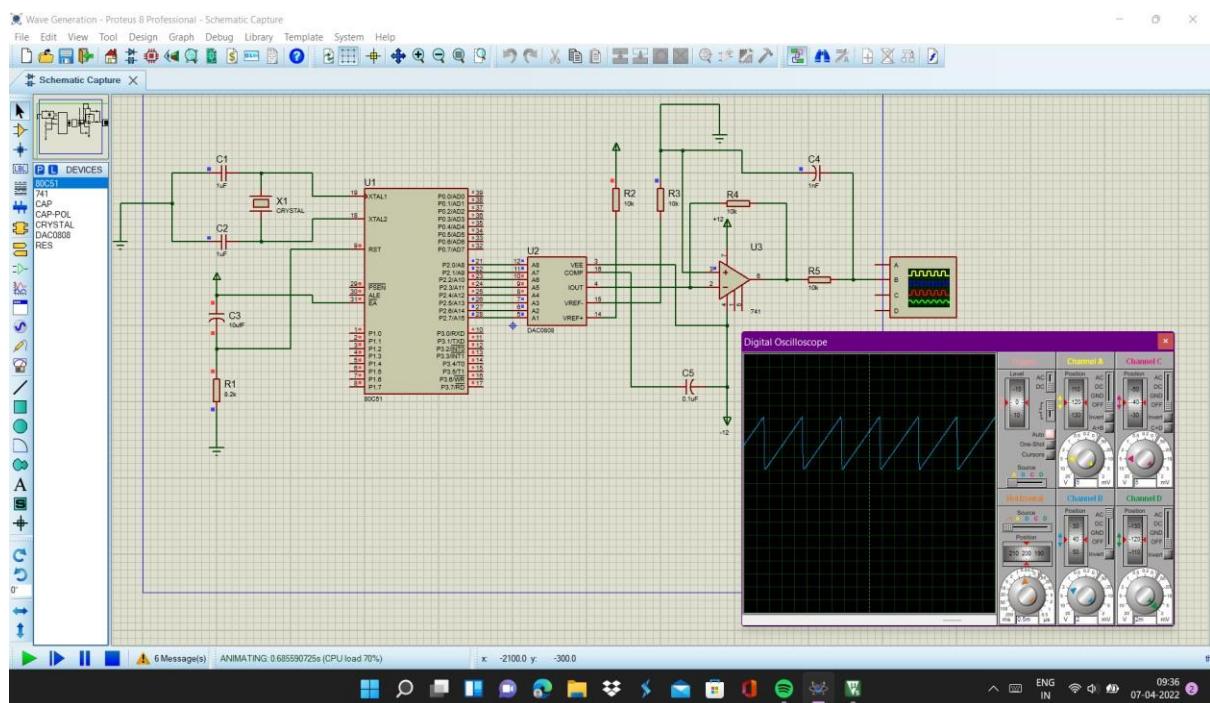

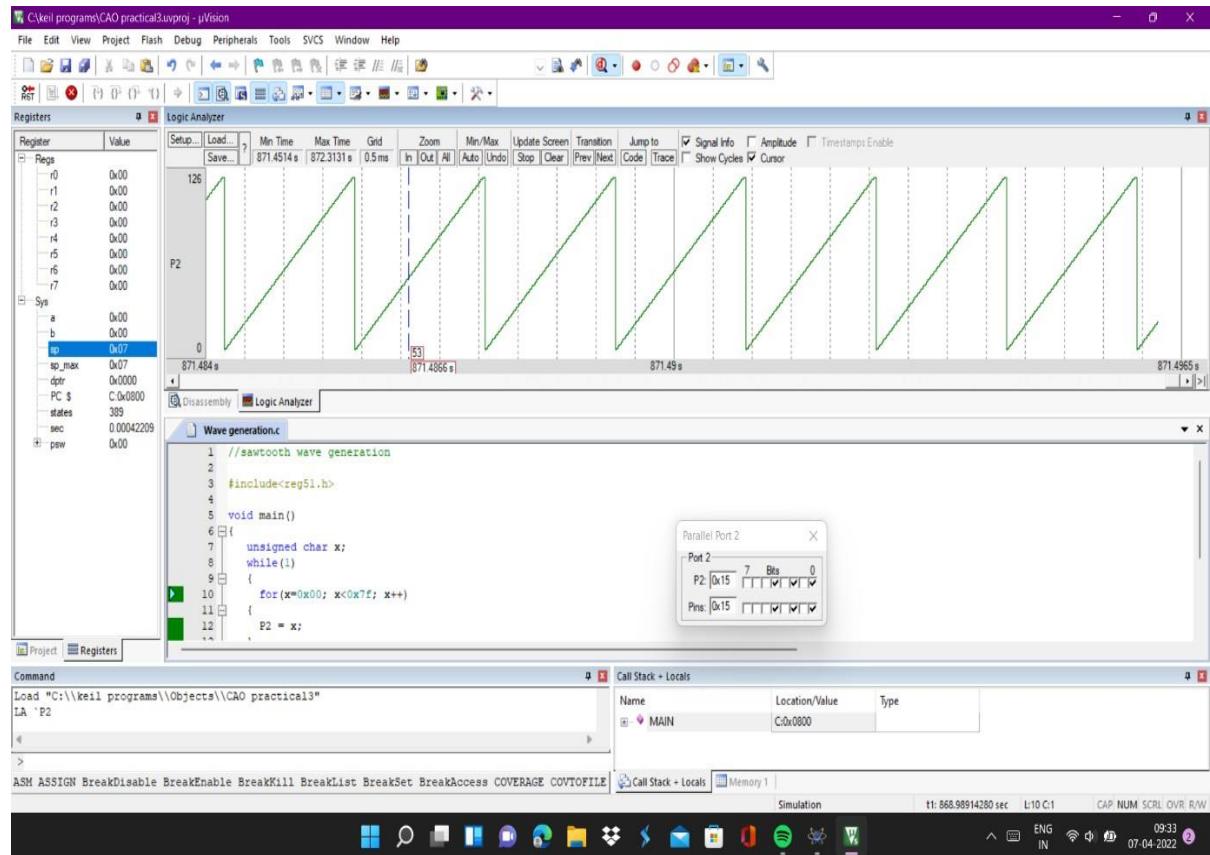

## 5.Sawtooth wave:

### Code:

```
//sawtooth wave generation
#include<reg51.h>
void main ()
{
    unsigned char x;
    while(1)
    {
        for(x=0x00; x<0x7f; x++)
        {
            P2 = x;
        }
        for(x=0x7f; x<0x00; x--)
        {
            P2 = x;
        }
    }
}
```

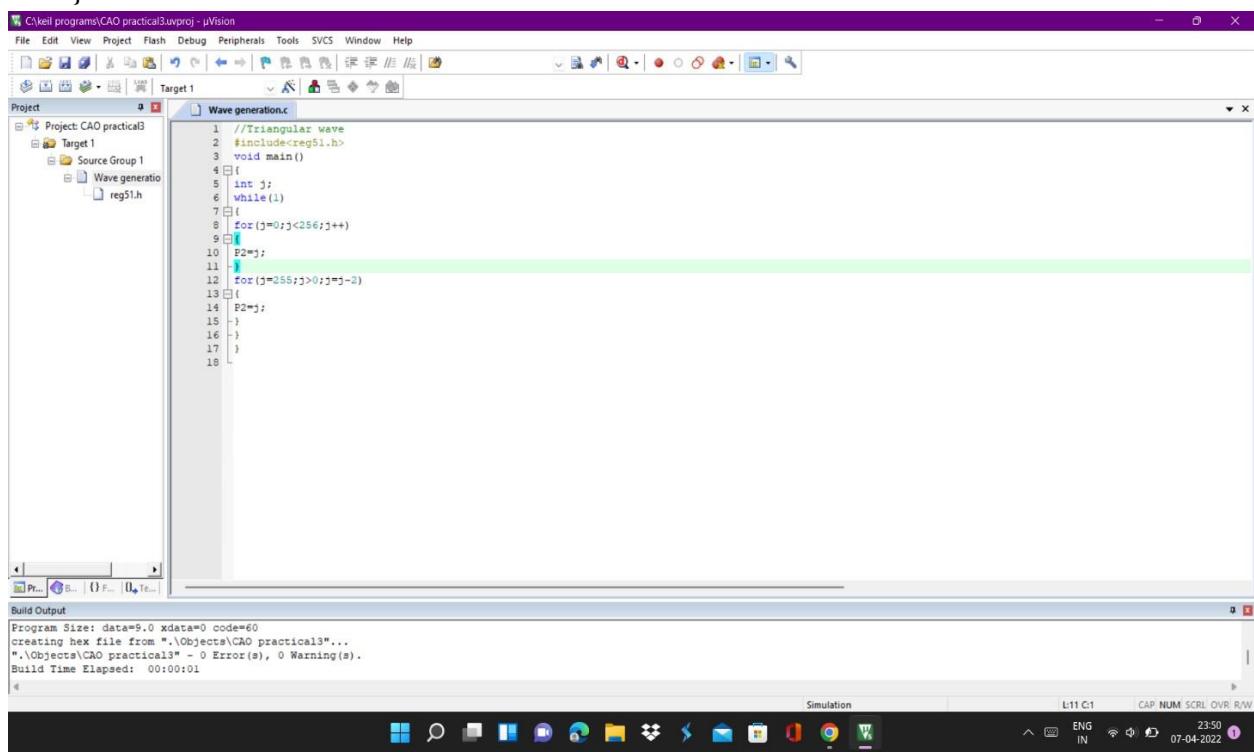

## Output:

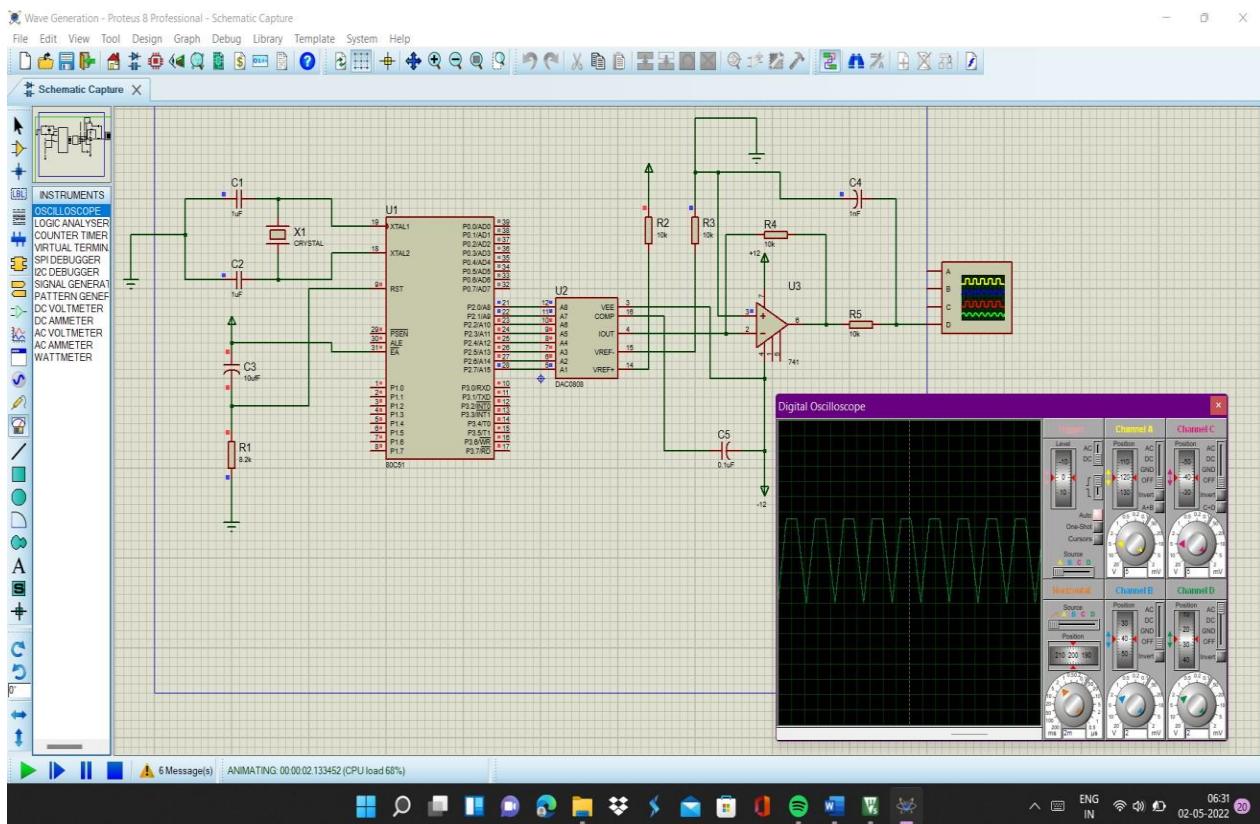

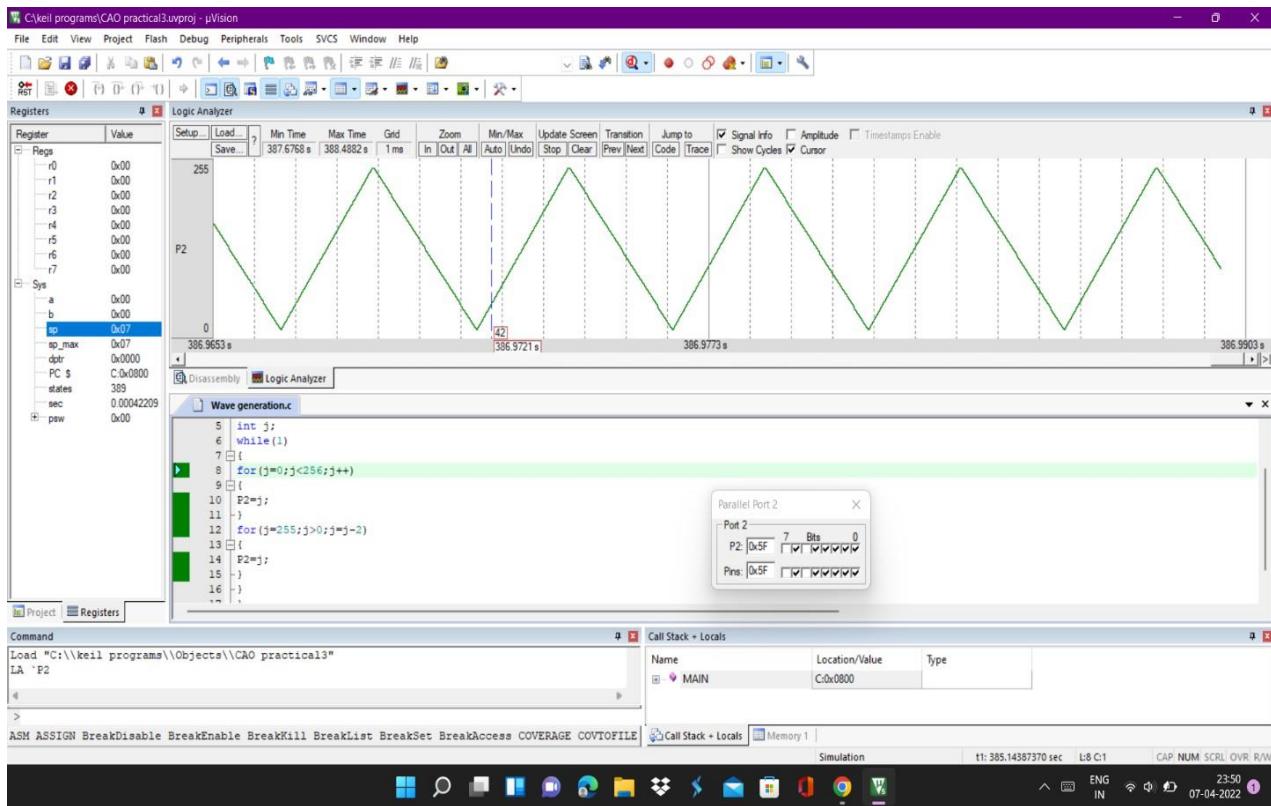

## 6.Triangular wave

### Code:

```
//Triangular wave
#include<reg51.h>
void main()
{
    int j;
    while(1)
    {
        for(j=0;j<256;j++)
        {
            P2=j;
        }
        for(j=255;j>0;j=j-2)
        {
            P2=j;
        }
    }
}
```

## Output:

**Conclusion:** Hence, we performed the generation of Square, Rectangular, Sine wave, Cosine wave, Sawtooth wave and Triangular wave using 8051.

## **EXPERIMENT NO. 4**

**Aim:** To interface LCD using 8051 microcontroller and displaying characters (AT89C51).

**Theory:** It is very important to keep a track of the working of almost all the automated and semi-automated devices, be it a washing machine, an autonomous robot or anything else. This is achieved by displaying their status on a small display module. LCD (Liquid Crystal Display) screen is such a display module and a 16x2 LCD module is very commonly used. These modules are replacing seven segments and other multi segment LEDs for these purposes.

The reasons being: LCDs are economical, easily programmable, have no limitation of displaying special & even custom characters (unlike in seven segments), animations and so on. LCD can be easily interfaced with a microcontroller to display a message or status of a device. This topic explains the basics of a 16x2 LCD and how it can be interfaced with AT89C51 to display a character. A 16x2 LCD means it can display 16 characters per line and there are 2 such lines. In this LCD each character is displayed in 5x7 pixel matrix. This LCD has two registers.

**1. Command/Instruction Register-** stores the command instructions given to the LCD. A command is an instruction given to LCD to do a predefined task like initializing, clearing the screen, setting the cursor position, controlling display etc.

**2. Data Register-** stores the data to be displayed on the LCD. The data is the ASCII value of the character to be displayed on the LCD

The AT89C51 is a low-power, high-performance CMOS 8-bit microcomputer with 4K bytes of Flash programmable and erasable read only memory (PEROM). The device is manufactured using Atmel's high-density non-volatile memory technology and is compatible with the industry-standard MCS-51 instruction set and pin-out. The on-chip Flash allows the program memory to be reprogrammed in-system or by a conventional non-volatile memory programmer. By combining a versatile 8-bit CPU with Flash on a

monolithic chip, the Atmel AT89C51 is a powerful microcomputer which provides a highly-flexible and cost-effective solution to many embedded control applications.

**Code:**

```
#include <reg51.h>
sbit rs=P1^0;
sbit rw=P1^1;
sbit e= P1^2;
void delay(unsigned int);
void cmd(unsigned char);
void dat(unsigned char);

void main(void)
{
    unsigned char ch[]="RAM
SHINGANE"; unsigned char
ch1[]="BE19F04F059";unsigned int
i,j,k;

    cmd(0x38);
    cmd(0x01);
    cmd(0x0c);
    cmd(0x83);
    cmd(0x06);

    for(i=0;ch[i]!='\0';i++)
        dat(ch[i]);

    cmd(0xc3);
    for(j=0;ch1[j]!='\0';j++)
    {
        dat(ch1[j]);
    }
```

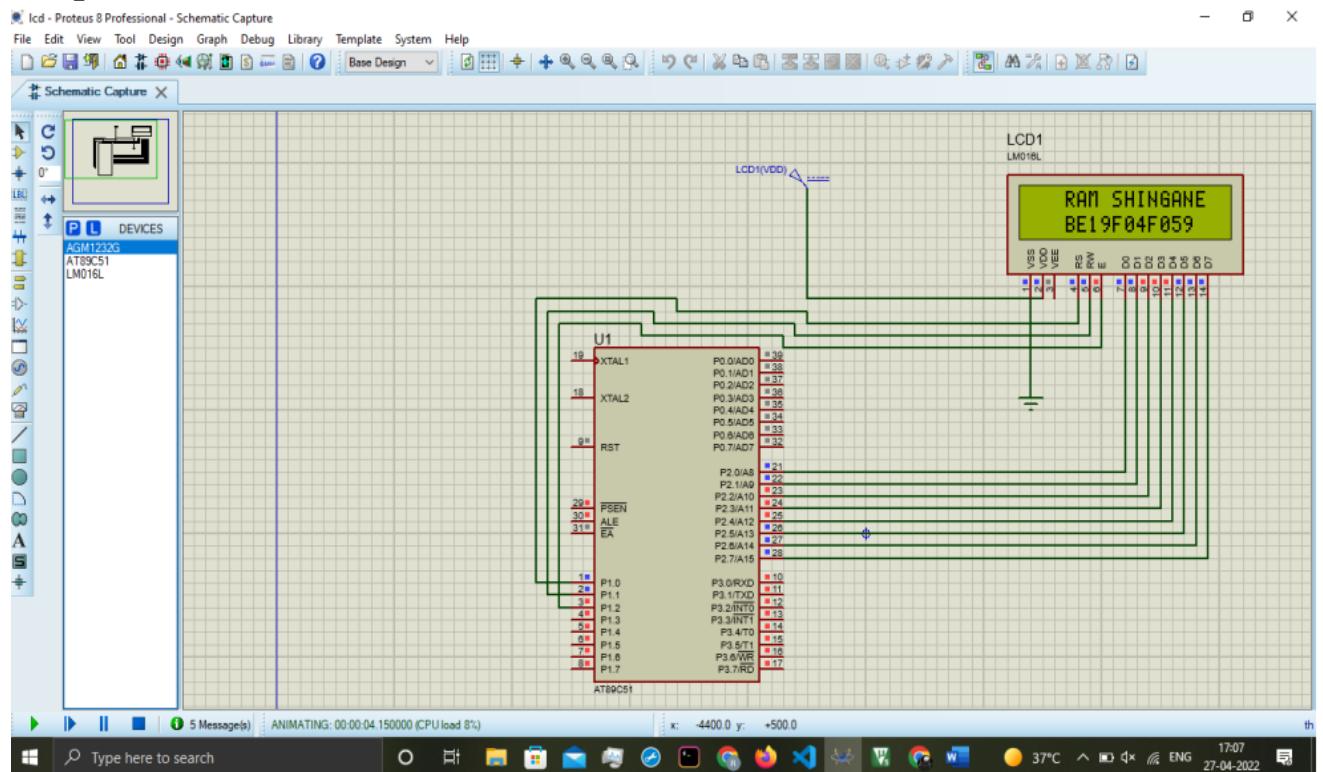

```
while(1){
    for(k=0;k<16;k++)
    {
        cmd(0x1c);
    }
}

void delay(unsigned int t)
{
    unsigned int i,j;
    e=1;
    for(i=0;i<t;i++)
    for(j=0;j<1275;j++);
    e=0;
}

void cmd(unsigned char ch)
{
    rs=0;
    rw=0;
    P2=ch;
    delay(20);
}

void dat(unsigned char ch)
{
    rs=1;
    rw=0;
    P2=ch;
    delay(20);
}
```

## Output:

## Conclusion:

Thus we have performed LCD interfacing and displayed the message name and roll number successfully.

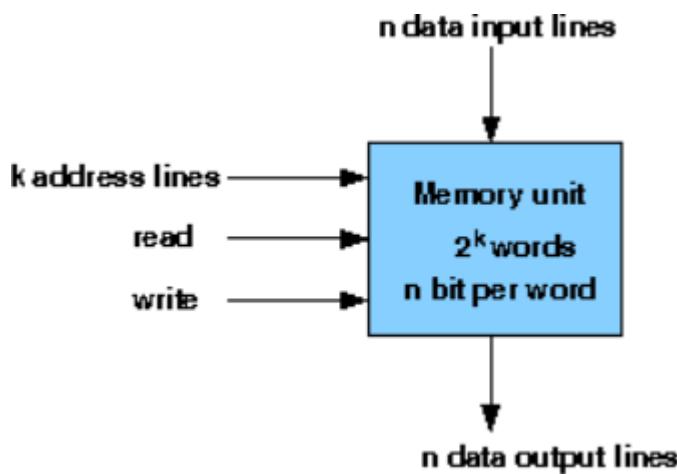

## EXPERIMENT NO. 5

**AIM:** To design memory units and understand how it operates during read and write operation.

### Theory:

#### Design of Memory:

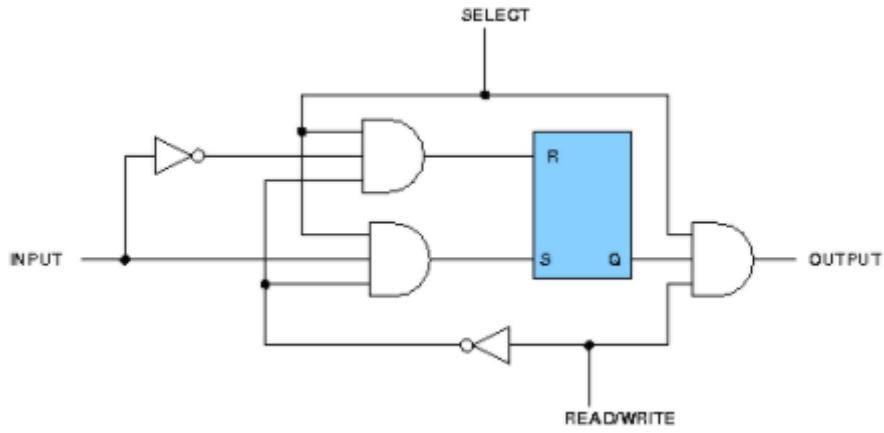

A memory unit is a collection of storage cells together with associated circuits needed to transform information in and out of the device. Memory cells which can be accessed for information transfer to or from any desired random location is called random access memory (RAM). The block diagram of a memory unit-

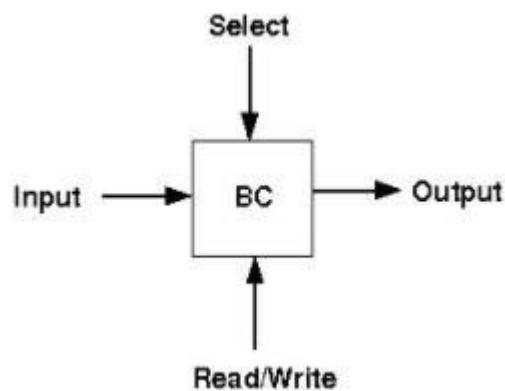

**Internal Construction:** The internal construction of a random-access memory of  $m$  words with  $n$  bits per word consists of  $m \times n$  binary storage cells and associated decoding circuits for selecting individual words. The binary cell is the basic building block of a memory unit.

#### RAM Design:

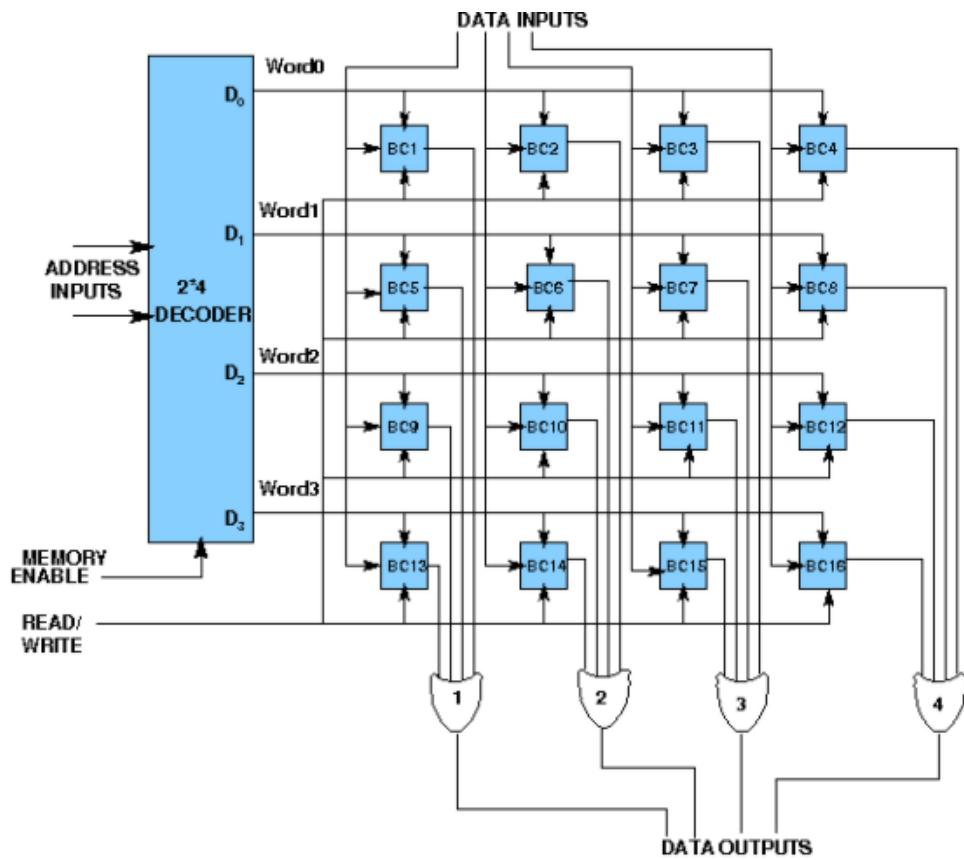

**Design of a RAM cell:** The binary cell has three inputs and one output. The select input enables the cell for reading or writing and the read/write input determines the cell operation when it is selected. A 1 in the read/write input provides the read operation by forming a path from the flip-flop to the output terminal. A 0 in the read/write input provides the write operation by forming a path from the input terminal to the flip-flop. the logic diagram is-

Design of a 4X4 RAM: The logical construction of a small RAM 4X3 is shown below. It consists of 4 words of 3 bits each and has a total of 12 binary cells. Each block labelled BC represents the binary cell with its 3 inputs and 1 output. The block diagram of a binary cell-

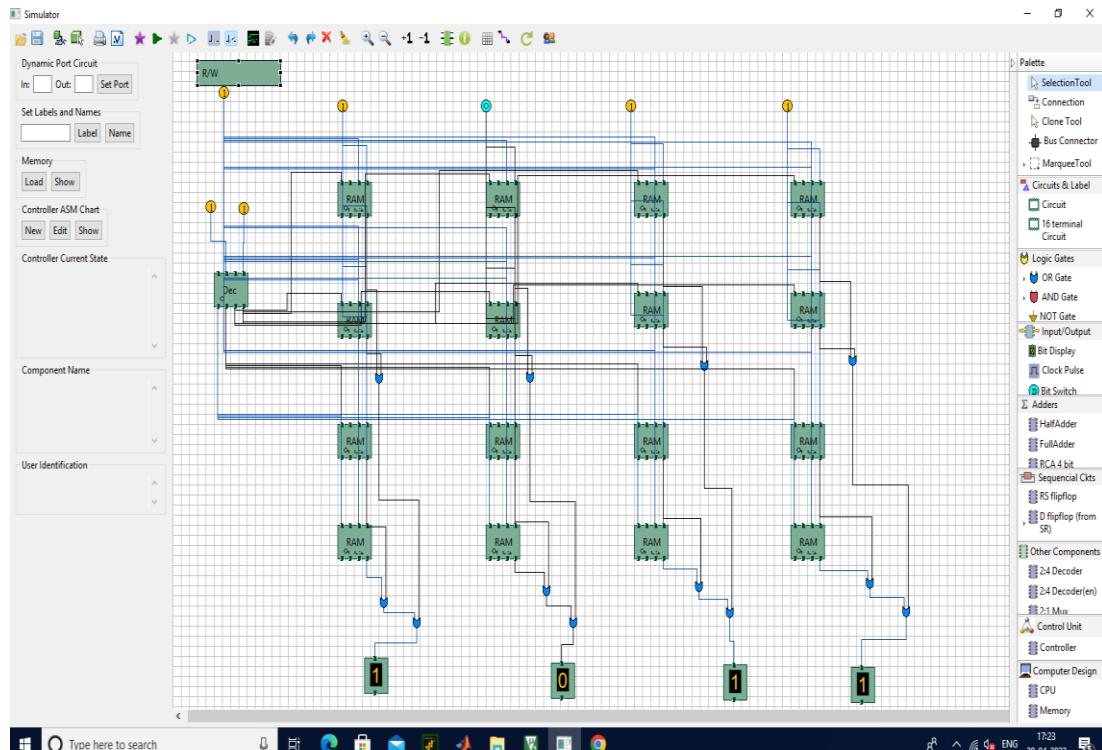

A memory with 4 words needs two address lines. The two address inputs go through a  $2 \times 4$  decoder to select one of the four words. The decoder is enabled with the memory enable input. When the memory enable is 0, all outputs of the decoder are 0 and none of the memorywords are selected. With the memory enable at 1, one of the four words is selected, dictated by the value in the two address lines. Once a word has been selected, the read/write input determines the operation. the logic diagram is-

### Design Issues:

A basic RAM cell has been provided here as a component which can be used to design larger memory units. An IC memory consisting of 4 words each having 3 bits has been also provided

### Output:

**Conclusion:**

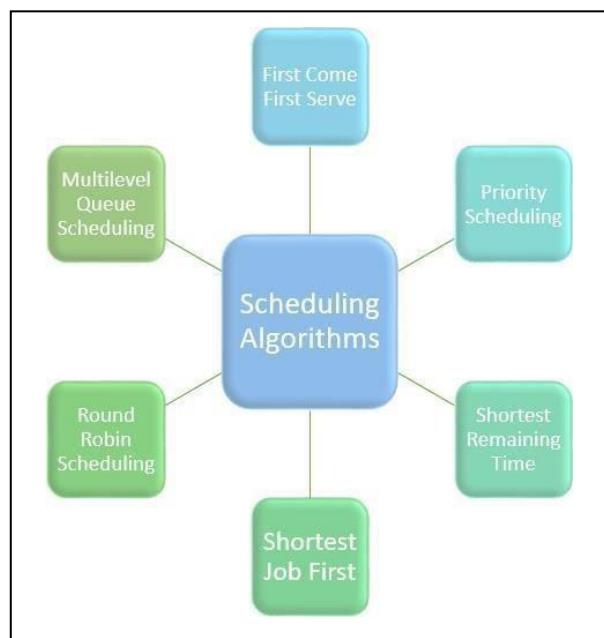

Memory Unit is Designed and its read -write operation is observed. Decoder decides the inputs to be selected using select inputs. Inputs can be changed while write operation. Decoder reads inputs from 2<sup>nd</sup> line of RAM cells and when its select inputs are 01.

# Experiment No. 6

**AIM:** Write a C program for CPU scheduling algorithm

**SOFTWARE USED:** Online C/C++ Editor

**THEORY:** A process scheduler schedules different processes to be assigned to the CPU based on particular scheduling algorithms. There are six popular process scheduling algorithms which we are going to mention are as follows:

These algorithms are either non preemptive or preemptive. Non-preemptive algorithms are designed so that once it cannot be preempted until it completes its allotted time, whereas a scheduler may preempt a low priority running process time when a high priority process enters into a ready state.

## Input Table :

Round Robin Scheduling		
Mode- Pre-emptive, Quantum time- 1 unit		
Process Id	Arrival Time	Burst Time
P1	0	5
P2	1	6
P3	2	3
P4	3	1
P5	4	5
P6	6	4

## Gantt Chart:

Ready Queue:

p1	p2	p1	p3	p4	p1	p2	p1	p5	p6	p1	p2
----	----	----	----	----	----	----	----	----	----	----	----

p3	p2	p3	p2	p6	p5	p2	p5	p6	p6	p5	p5
----	----	----	----	----	----	----	----	----	----	----	----

Running Queue:

p1	p2	p1	p3	p4	p1	p2	p1	p5	p6	p1	p2
0	1	2	3	4	5	6	7	8	9	10	11
p3	p2	p3	p2	p6	p5	p2	p5	p6	p6	p5	p5
12	13	14	15	16	17	18	19	20	21	22	23

## Output Table:

Shortest Job First Scheduling
Mode- Non-pre-emptive

Process Id	Arrival Time	Burst Time	Completion Time	Turn Around Time	Waiting Time	Response Time
P1	0	5	11	11	6	0
P2	1	6	19	18	12	0
P3	2	3	15	13	10	1
P4	3	1	5	2	1	1
P5	4	5	24	20	15	4
p6	6	4	22	16	12	3

Average TAT :- 13.33

Average WT :- 9.33

## Code :

```
#include<stdio.h> struct
process
{ int id,AT,BT,WT,TAT;
};

struct process a[10];// declaration of the ready queue
int queue[100]; int front=-1; int rear=-1;

// function for insert the element // into
queue void insert(int n)
{ if(front== -1)
    front=0;
    rear=rear+1;
    queue[rear]=n;
}

// function for delete the //
element from queue int
_delete()
{ int n; n=queue[front];
front=front+1; return n;
}

int main()
{ int n,TQ,p,TIME=0; int temp[10],exist[10]={0}; float
    total_wt=0,total_tat=0,Avg_WT,Avg_TAT; printf("Enter the number of the
    processes\n"); scanf("%d",&n); printf("Enter the arrival time and burst time of the
    process\n"); printf("AT BT\n"); for(int i=0;i<n;i++)
{ scanf("%d%d",&a[i].AT,&a[i].BT);
    a[i].id=i; temp[i]=a[i].BT;
} printf("Enter the time quantum\n");
scanf("%d",&TQ);
// logic for round robin scheduling
```

```

// insert first process
// into ready queue insert(0);
exist[0]=1; // until ready queue is
empty while(front<=rear)
{ p=_delete();
  if(a[p].BT>=TQ)
  { a[p].BT=a[p].BT-TQ;
    TIME=TIME+TQ;

  }
  else
  {
    TIME=TIME+a[p].BT; a[p].BT=0;
  }

//if process is not exist

// in the ready queue even a single

// time then insert it if it arrive // at time
'TIME' for(int i=0;i<n;i++)
{ if(exist[i]==0 && a[i].AT<=TIME)
  { insert(i);
    exist[i]=1;
  }
}

// if process is completed if(a[p].BT==0)
{
  a[p].TAT=TIME-a[p].AT;
  a[p].WT=a[p].TAT-temp[p];
  total_tat=total_tat+a[p].TAT;
  total_wt=total_wt+a[p].WT;
}
else
{ insert(p);
}

}

Avg_TAT=total_tat/n;
Avg_WT=total_wt/n;

// printing of the answer
printf("ID WT TAT\n"); for(int
i=0;i<n;i++)
{ printf("%d %d %d\n",a[i].id,a[i].WT,a[i].TAT);
} printf("Average waiting time of the processes is : %f\n",Avg_WT); printf("Average turn around
time of the processes is : %f\n",Avg_TAT); return 0;

```

## Output:

The screenshot shows a C++ online compiler interface on a Windows desktop. The code in main.cpp implements a Round Robin scheduling algorithm. The user inputs the number of processes (6), arrival times, burst times, and a time quantum. The output displays the process ID, waiting time, and turn-around time for each process.

```
main.cpp
...
29     n=queue[front];
30     front=front+1;
31     return n;
32 }
33 int main()
34 {
35     int n,TQ,p,TIME=0;
36     int temp[10],exist[10]={0};
37     float total_wt=0,total_tat=0,Avg_WT,Avg_TAT;
38     printf("Enter the number of the processes\n");
39     scanf("%d",&n);
40     printf("Enter the arrival time and burst time of the processes\n");
41     printf("AT BT\n");
42     for(int i=0;i<n;i++)
43     {
44         scanf("%d%d",&a[i].AT,&a[i].BT);
45         a[i].id=i;
46         temp[i]=a[i].BT;
47     }
48     printf("Enter the time quantum\n");
49     scanf("%d",&TQ);
50     // logic for round robin scheduling
51
52     // insert first process

## Conclusion:

Hence, we performed CPU Scheduling algorithm practical by Mode- Pre-emptive Round Robin Scheduling using c programming.

## Experiment No. 7

**Aim:** Write a C program for the memory management algorithm.

**Theory:** Memory Management is the process of controlling and coordinating computer memory, assigning portions known as blocks to various running programs to optimize the overall performance of the system.

It is the most important function of an operating system that manages primary memory. It helps processes to move back and forward between the main memory and execution disk. It helps OS to keep track of every memory location, irrespective of whether it is allocated to some process or it remains free.

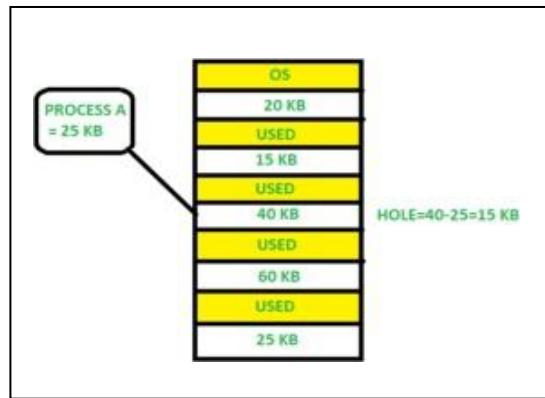

In **Partition Allocation**, when there is more than one partition freely available to accommodate a process's request, a partition must be selected. To choose a particular partition, a partition allocation method is needed. A partition allocation method is considered better if it avoids internal fragmentation.

When it is time to load a process into the main memory and if there is more than one free block of memory of sufficient size then the OS decides which free block to allocate.

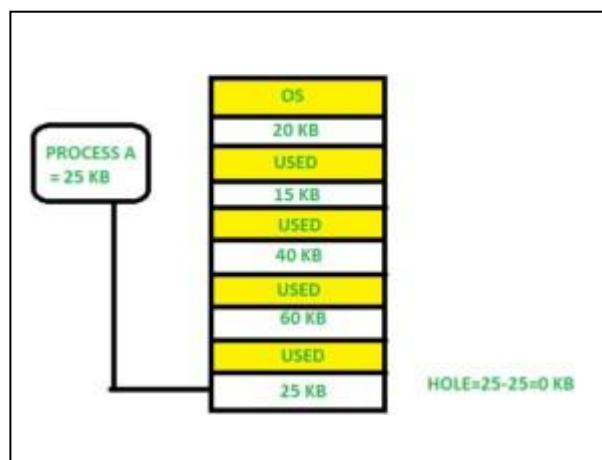

There are different Placement Algorithm:

- A. First Fit
- B. Best Fit
- C. Worst Fit
- D. Next Fit

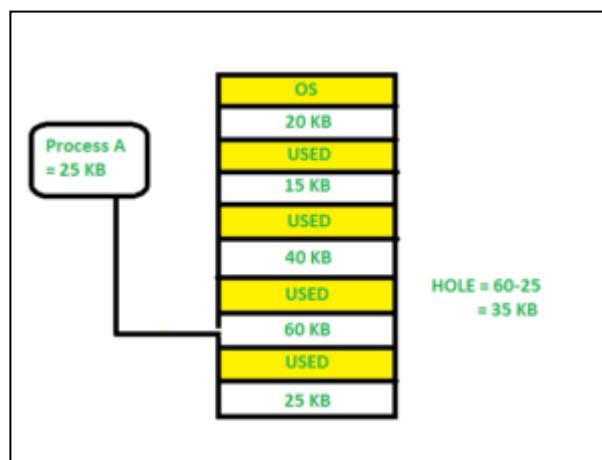

**1. First Fit:** In the first fit, the partition is allocated which is the first sufficient block from the top of Main Memory. It scans memory from the beginning and chooses the first available block that is large enough. Thus, it allocates the first hole that is large enough.

**2. Best Fit** Allocate the process to the partition which is the first smallest sufficient partition among the free available partition. It searches the entire list of holes to find the smallest hole whose size is greater than or equal to the size of the process.

**3. Worst Fit** Allocate the process to the partition which is the largest sufficient among the freely available partitions available in the main memory. It is opposite to the best-fit algorithm. It searches the entire list of holes to find the largest hole and allocate it to process.

**4. Next Fit:** Next fit is similar to the first fit but it will search for the first sufficient partition from the last allocation point.

**CODE :**

**A. First Fit**

```
// C++ implementation of First - Fit algorithm
#include<bits/stdc++.h> using namespace
std;

// Function to allocate memory to // blocks as
per First fit algorithm void firstFit(int
blockSize[], int m,
    int processSize[], int n)
{
    // Stores block id of the
    // block allocated to a process
    int allocation[n];

    // Initially no block is assigned to any process memset(allocation, -1,
    sizeof(allocation));

    // pick each process and find suitable blocks // according
    to its size ad assign to it for (int i = 0; i < n; i++)
    { for (int j = 0; j < m; j++)
        { if (blockSize[j] >= processSize[i])
            {
                // allocate block j to p[i] process allocation[i] = j;
```

```

// Reduce available memory in this block. blockSize[j] -=
processSize[i];

        break;
    }
} }

cout << "\nProcess No.\tProcess Size\tBlock no.\n";
for (int i = 0; i < n; i++)
{ cout << " " << i+1 << "\t\t"
    << processSize[i] << "\t\t"; if
(allocation[i] != -1) cout << allocation[i] + 1;
else cout << "Not Allocated";
cout << endl;
}

// Driver code int main()
{ int blockSize[] = {100, 500, 200, 300, 600}; int processSize[] = {212,
417, 112, 426}; int m = sizeof(blockSize) / sizeof(blockSize[0]);
int n = sizeof(processSize) / sizeof(processSize[0]);

firstFit(blockSize, m, processSize, n);

return 0 ;
}

```

## OUTPUT :

The screenshot shows a web browser window with multiple tabs open. The active tab is 'Programiz C++ Online Compiler'. The code editor contains a C++ program named 'main.cpp' which implements a first-fit algorithm for process allocation. The output window displays the results of the execution.

```
main.cpp
40     << processSize[i] << "\t\t";
41     if (allocation[i] != -1)
42         cout << allocation[i] + 1;
43     else
44         cout << "Not Allocated";
45     cout << endl;
46 }
47 }
48 // Driver code
49 int main()
50 {
51     int blockSize[] = {100, 500, 200, 300, 600};
52     int processSize[] = {212, 417, 112, 426};
53     int m = sizeof(blockSize) / sizeof(blockSize[0]);
54     int n = sizeof(processSize) / sizeof(processSize[0]);
55
56     firstFit(blockSize, m, processSize, n);
57
58     return 0 ;
59 }
```

Output

```
/tmp/sPvcjgkrQv.o
Process No. Process Size    Block no.
1          212      2
2          417      5
3          112      2
4          426      Not Allocated
```

## B. Best Fit

```
// C++ implementation of Best - Fit algorithm
#include<bits/stdc++.h> using namespace
std;

// Function to allocate memory to blocks as per Best fit
// algorithm
void bestFit(int blockSize[], int m, int processSize[], int n)
{
    // Stores block id of the block allocated to a
    // process int allocation[n];

    // Initially no block is assigned to any process memset(allocation, -1,
    sizeof(allocation));

    // pick each process and find suitable blocks // according
    to its size ad assign to it for (int i=0; i<n; i++)
    {
        // Find the best fit block for current process int bestIdx =
        -1; for (int j=0; j<m; j++)
        { if (blockSize[j] >= processSize[i])
            { if (bestIdx == -1) bestIdx = j;
            else if (blockSize[bestIdx] > blockSize[j])
                bestIdx = j;
            } }
        // If we could find a block for current process if (bestIdx != -
        1)
```

```

{
    // allocate block j to p[i] process allocation[i] = bestIdx;

    // Reduce available memory in this block.
    blockSize[bestIdx] -= processSize[i];
}

cout << "\nProcess No.\tProcess Size\tBlock no.\n"; for (int i = 0; i <
n; i++)
{ cout << " " << i+1 << "\t\t" << processSize[i] << "\t\t"; if (allocation[i]
!= -1)
    cout << allocation[i] + 1;
else
    cout << "Not Allocated";
cout << endl;
}

// Driver code int main()
{ int blockSize[] = {100, 500, 200, 300, 600};

    int processSize[] = {212, 417, 112, 426};

    int m = sizeof(blockSize)/sizeof(blockSize[0]); int n =
    sizeof(processSize)/sizeof(processSize[0]);

    bestFit(blockSize, m, processSize, n);

    return 0 ;
}

```

}

## OUTPUT :

The screenshot shows a C++ online compiler interface on a Windows desktop. The code editor contains a file named main.cpp with the following content:

```
1 // C++ Implementation of Best - Fit algorithm
2 #include<bits/stdc++.h>
3 using namespace std;
4
5 // Function to allocate memory to blocks as per Best fit
6 // algorithm
7 void bestFit(int blockSize[], int m, int processSize[], int n)
8 {
9     // Stores block id of the block allocated to a
10    // process
11    int allocation[n];
12
13    // Initially no block is assigned to any process
14    memset(allocation, -1, sizeof(allocation));
15
16    // pick each process and find suitable blocks
17    // according to its size ad assign to it
18    for (int i=0; i<n; i++)
19    {
20        // Find the best fit block for current process
21        int bestIdx = -1;
22        for (int j=0; j<m; j++)

```

The output window displays the results of the execution:

```
Process No. Process Size Block no.
1 212 4
2 417 2
3 112 3
4 426 5
```

The browser tab bar at the top shows various open tabs including 'Experiment No. 7 - Google', '(2) WhatsApp', 'Program for Best Fit algorithm', and 'Online C++ Compiler'. The system tray at the bottom right shows network speed (0.4 Kbps), battery level, and the date/time (22-05-2022, 02:18 PM).

### C. Worst Fit

```
// C++ implementation of worst - Fit algorithm

#include<bits/stdc++.h> using namespace
std;

// Function to allocate memory to blocks as per worst fit
// algorithm

void worstFit(int blockSize[], int m, int processSize[],
              int n)

{

    // Stores block id of the block allocated to a
    // process int allocation[n];

    // Initially no block is assigned to any process memset(allocation, -1,
    sizeof(allocation));

    // pick each process and find suitable blocks // according
    to its size ad assign to it for (int i=0; i<n; i++)

    {

        // Find the best fit block for current process int wstIdx = -
        1; for (int j=0; j<m; j++)
        { if (blockSize[j] >= processSize[i])

            { if (wstIdx == -1) wstIdx = j;
              else if (blockSize[wstIdx] < blockSize[j]) wstIdx = j;
            }
        }

        // If we could find a block for current process if (wstIdx != -
        1)
        {
    }
```

```

    // allocate block j to p[i] process allocation[i] = wstIdx;

    // Reduce available memory in this block.
    blockSize[wstIdx] -= processSize[i];

} }

cout << "\nProcess No.\tProcess Size\tBlock no.\n"; for (int i = 0; i <
n; i++)
{ cout << " " << i+1 << "\t\t" << processSize[i] << "\t\t"; if (allocation[i] !=
-1) cout << allocation[i] + 1;
else cout << "Not Allocated";
cout << endl;
}

// Driver code int main()
{ int blockSize[] = {100, 500, 200, 300, 600}; int processSize[] = {212,
417, 112, 426}; int m = sizeof(blockSize)/sizeof(blockSize[0]);
int n = sizeof(processSize)/sizeof(processSize[0]);

worstFit(blockSize, m, processSize, n);

return 0 ;
}

```

## Output:

The screenshot shows a Windows desktop environment. A browser window is open, displaying an online C++ compiler interface. The compiler window has tabs for "main.cpp" and "Output". The code in "main.cpp" implements a worst-fit algorithm to allocate processes to blocks. The "Output" tab shows the results of the compilation and execution.

```
main.cpp
48     cout << " " << i+1 << "\t\t" << processSize[i] << "\t\t";
49     if (allocation[i] != -1)
50         cout << allocation[i] << 1;
51     else
52         cout << "Not Allocated";
53     cout << endl;
54 }
56
57 // Driver code
58 int main()
59 {
60     int blockSize[] = {100, 500, 200, 300, 600};
61     int processSize[] = {212, 417, 112, 426};
62     int m = sizeof(blockSize)/sizeof(blockSize[0]);
63     int n = sizeof(processSize)/sizeof(processSize[0]);
64
65     worstFit(blockSize, m, processSize, n);
66
67     return 0 ;
68 }
69
```

Output

```
/tmp/sPvcjqkrQv.o
Process No. Process Size Block no.
1      212      5
2      417      2
3      112      5
4      426      Not Allocated
```

## D. Next Fit

```
#include<iostream>
#include<algorithm> using namespace
std;

struct node{ int memsize; int
allocp=-1; int pos; int
allocSize; }m[200];

bool posSort(node a,node b){
    return a.pos < b.pos;
}

bool memSort(node a,node b){
    return a.memsize < b.memsize;
}

int main(){
    int nm,np,choice, i, j, p[200]; cout<<"Enter
    number of blocks\n"; cin>>nm; cout<<"Enter
    block      size\n";           for(i=0;i<nm;i++){
    cin>>m[i].memsize; m[i].pos=i; }

    cout<<"Enter number of processes\n"; cin>>np;

    cout<<"Enter process size\n"; for(i=0;i<np;i++){
    cin>>p[i]; } cout<<"\n\n"; int
    globalFlag=0; int pos = -1;
```

```

for(i=0;i<np;i++){
    int flag=0; for(j=pos+1;j<nm;j++){
        if(j==nm){
            j=0;

        } if(j==pos)
            break;

        if(p[i]<=m[j].memsize && m[j].allocp==-1){
            m[j].allocp=i; m[j].allocSize=p[i]; flag=1; pos =
            j; if(j==nm-1){ j=0; pos = -1; } break;
        } } if(flag==0){ cout<<"Unallocated Process P"<<i+1<<"\n";
globalFlag=1;
    }
} sort(m,m+nm, posSort);

cout<<"\n"; int intFrag=0,extFrag=0;
cout<<"Memory\t\t";
for(i=0;i<nm;i++){
    cout<<m[i].memsize<<"\t";
} cout<<"\n"; cout<<"P.
Alloc.\t"; for(i=0;i<nm;i++){
    if(m[i].allocp!=-1){
        cout<<"P"<<m[i].allocp+1<<"\t";
    }
    else{
        cout<<"Empty\t";
    }
} cout<<"\n"; cout<<"Int. Frag.\t";
for(i=0;i<nm;i++){ if(m[i].allocp!=-

```

```
1){  
    cout<<m[i].memsize-m[i].allocSize<<"\t"; intFrag+=m[i].memsize-  
    m[i].allocSize;  
}  
else{  
    extFrag+=m[i].memsize; cout<<"Empty\t";  
}  
}  
cout<<"\n"; cout<<"\n";  
  
if(globalFlag==1)  
    cout<<"Total External Fragmentation: "<<extFrag<<"\n";  
else  
{ cout<<"Available Memory: "<<extFrag<<"\n";  
}  
  
cout<<"Total Internal Fragmentation: "<<intFrag<<"\n"; return 0;  
}
```

## OUTPUT :

The screenshot shows a C++ online compiler interface on a Windows desktop. The code in the editor is for memory fragmentation analysis. The output window displays the execution results, including user inputs for blocks and processes, and the resulting memory allocation table and fragmentation metrics.

```
main.cpp
83
84     }
85     cout<<"\n";
86     cout<<"Int. Frag.\n";
87     for(i=0;i<n;i++){
88         if(m[i].allocp!=1){
89             cout<<m[i].memsize m[i].allocSize<<"\t";
90             intFrag+=m[i].memsize-m[i].allocSize;
91         }
92         else{
93             extFrag+=m[i].memsize;
94             cout<<"Empty\n";
95         }
96     }
97     cout<<"\n";
98     cout<<"\n";
99
100    if(globalFlag==1)
101        cout<<"Total External Fragmentation: "<<extFrag<<"\n";
102    else
103    {
104        cout<<"Available Memory: "<<extFrag<<"\n";
105    }
106
107    cout<<"Total Internal Fragmentation: "<<intFrag<<"\n";
...

```

Output:

```

```

**Conclusion:**

Here, we performed memory management algorithm like First fit, Next fit, Worst fit, Best fit practical using C programming language.

## **Experiment No. 8**

**Aim: Installing Ubuntu using virtual box, and study virtualization.**

**Theory:**

**Introduction to VirtualBox-**

**VirtualBox allows us to run an entire operating system inside another operating system.**

*Advantages of virtual installation*

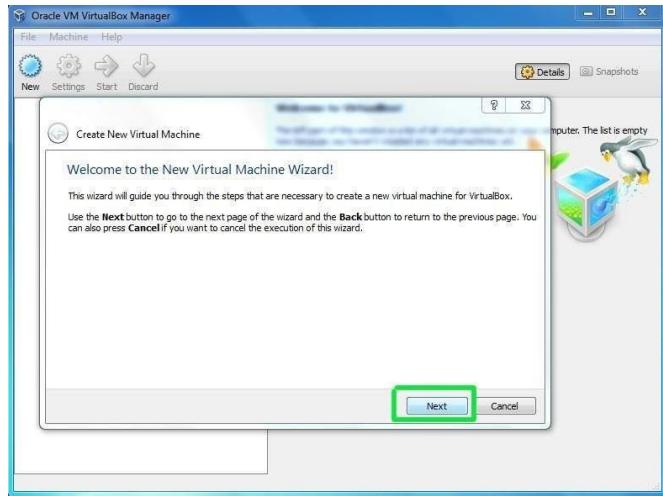

- The size of the installation does not have to be predetermined. It can be a dynamically resized virtual hard drive.
- No reboot needed in order to switch between Ubuntu and Windows.
- The virtual machine will use Windows internet connection.
- The virtual machine will set up its own video configuration.
- For troubleshooting purposes, take screenshots of any part of Ubuntu (including the boot menu or the login screen).
- It's low commitment. We can uninstall VirtualBox and terminate Ubuntu.

*Disadvantages of virtual installation*

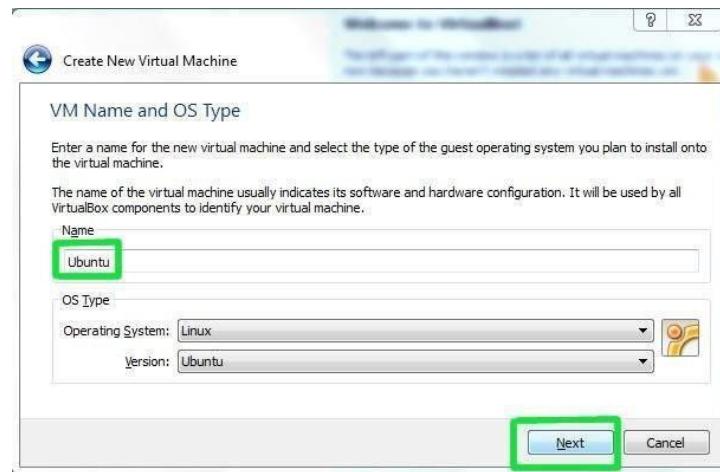

- In order to get any kind of decent performance, at least 512 MB of RAM is needed, because we are running an entire operating system (Ubuntu) inside another entire operating system (Windows).
- Even though the low commitment factor can seem like an advantage at first, if we later decide we want to switch to Ubuntu and ditch Windows completely, we cannot simply delete Windows partition.
- Every time we want to use Ubuntu, we have to wait for two boot times (the time it takes to boot Windows, and then the time it takes to boot Ubuntu within Windows).

**Installation steps-**

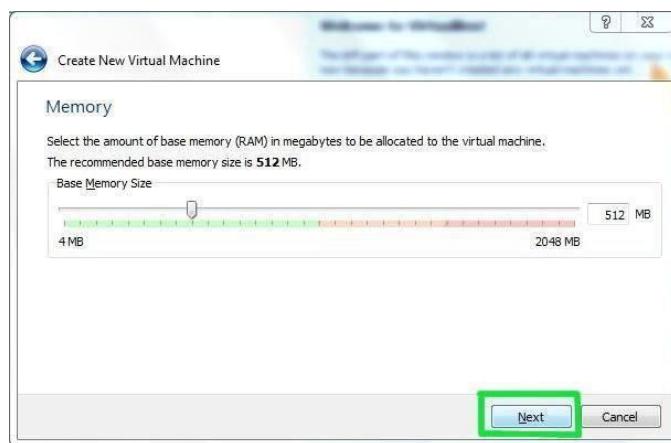

1. [Download VirtualBox using the link - https://www.virtualbox.org/wiki/Downloads](https://www.virtualbox.org/wiki/Downloads)
2. Follow these instructions to get an Ubuntu disk image (.iso file).

3. After you launch VirtualBox from the Windows Start menu, click on New to create a new virtual machine. When the New Virtual Machine Wizard appears, click Next.

4. Assign title to the machine also specify that the operating system is Linux.

5. VirtualBox will try to guess memory (or RAM) to allocate for the virtual machine. If we have 1 GB or less of RAM, proceed as it is with the recommendation. If we have over 1 GB, about a quarter RAM or less should be fine. For example, if we have 2 GB of RAM,

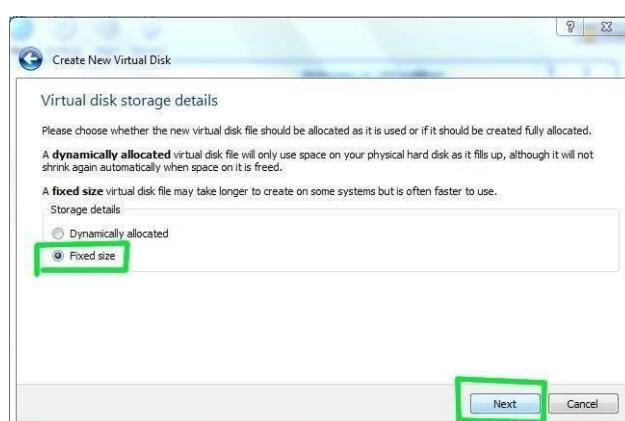

512 MB is fine to allocate. If we have 4 GB of RAM, 1 GB is fine to allocate. If we have no idea what RAM is or how much of it we have, just go with the default. Click Next.

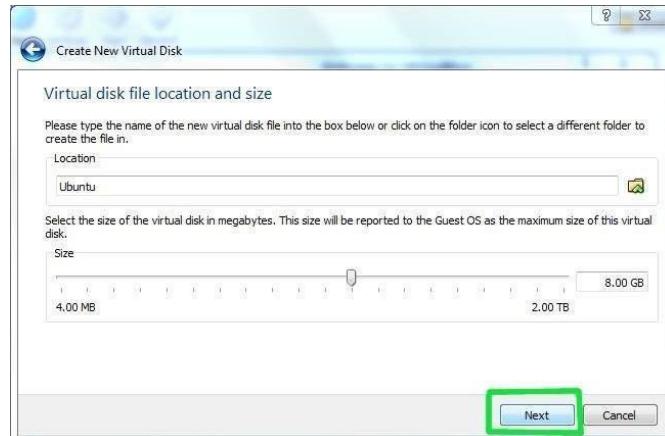

6. Create new hard disk and then click Next.

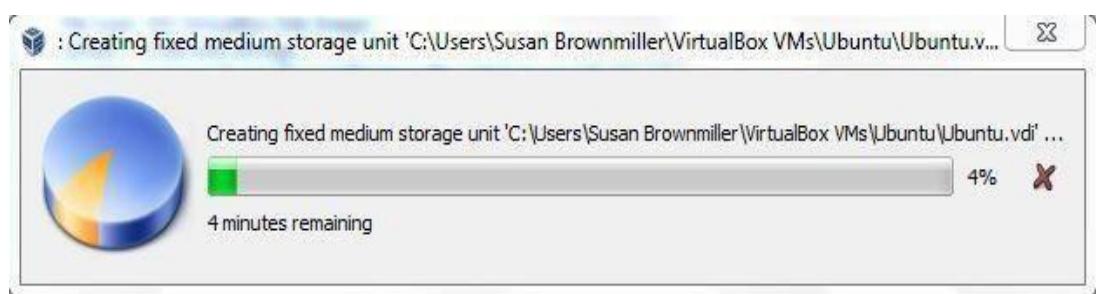

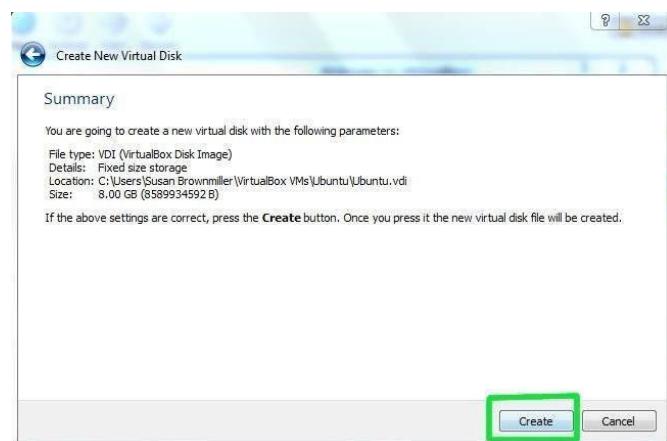

7. Click Next again.

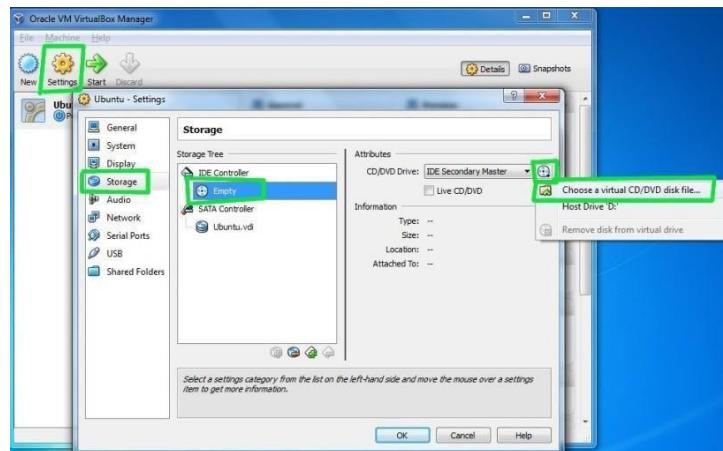

8. A dynamically expanding virtual hard drive is best, because it takes up only what actually is used. But when installing new software in a virtualized Ubuntu, in which the virtual hard drive fills up instead of expanding. So it is recommended to Fixed-size storage.

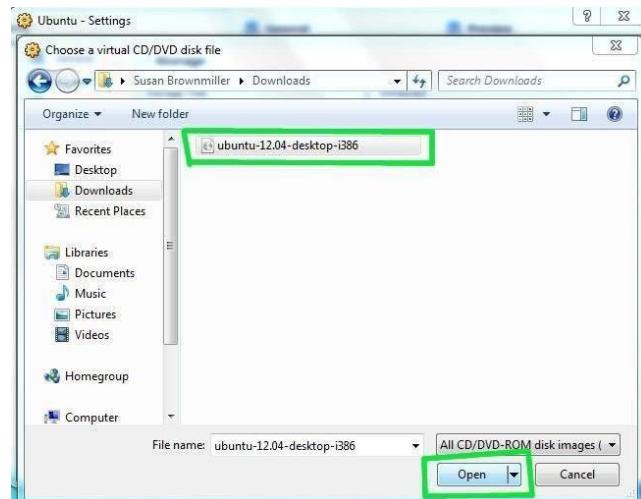

9. Ubuntu's default installation is less than 3 GB

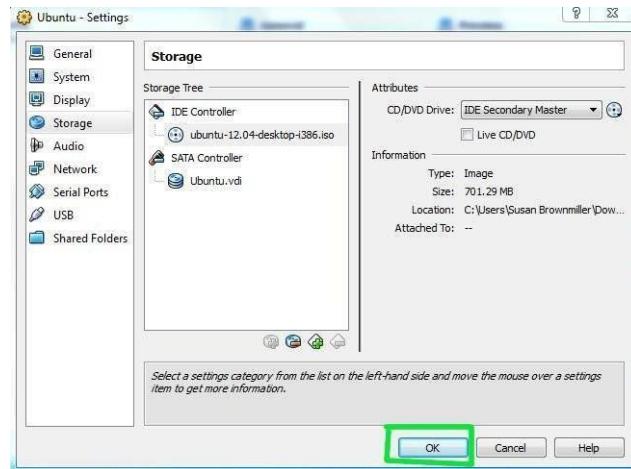

10. Click Create and wait for the virtual hard drive to be created. This is actually a very large file that lives inside of Windows installation.

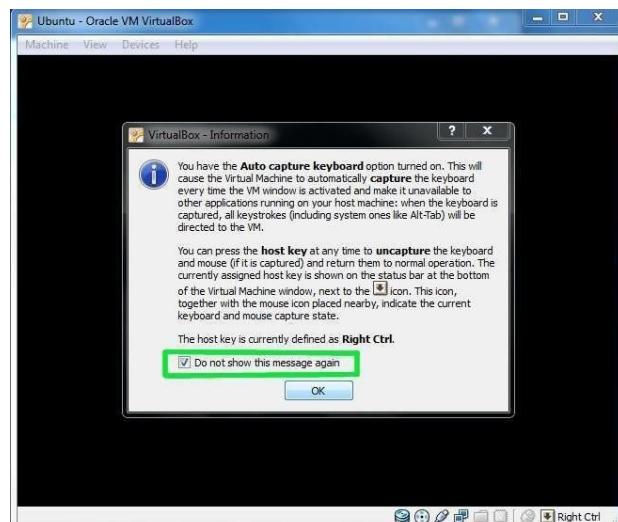

11. Now make the (currently blank) virtual hard drive useful is to add the downloaded **Ubuntu disk image (the .iso) boot on virtual machine**. Click on **Settings** and **Storage**. Then, under **CD/DVD Device**, next to **Empty**,Click the folder icon.

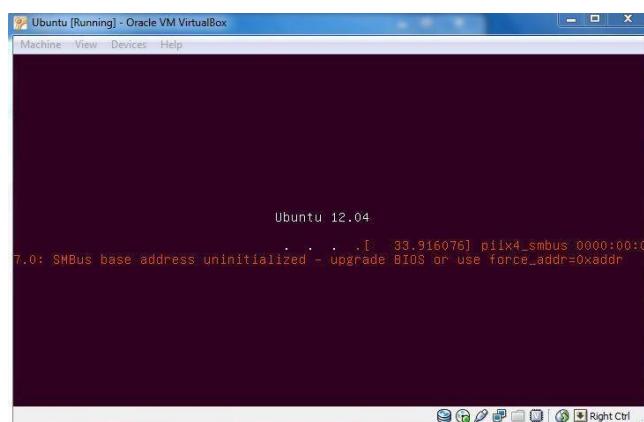

12. Select the Ubuntu .iso that was downloaded earlier.

13. After selection, click OK. Then double-click virtual machine to start it up.

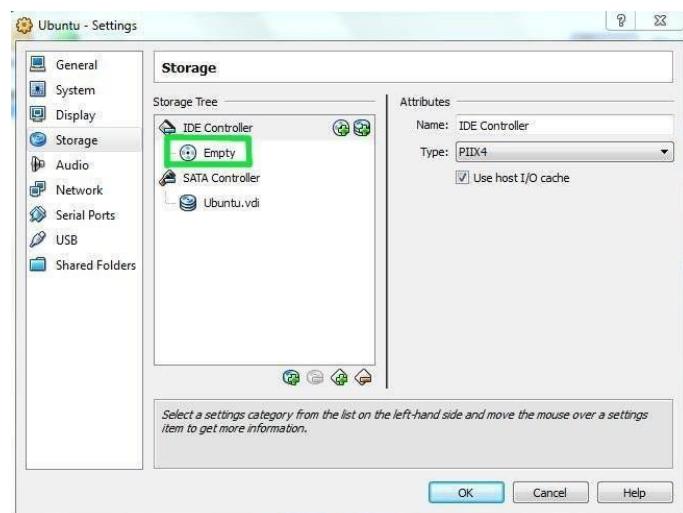

14. A bunch of random warnings/instructions about how to operate the guest operating system within VirtualBox.

15. Wait for Ubuntu to boot up.

16. Once it is started up, just follow the regular installation procedure

17. In order to use virtualized installation (instead of continually booting the live CD), double-check that the *CD/DVD Device* entry is Empty again

**Conclusion:** Thus, we have studied virtualization and undergone the steps of installing Ubuntu using virtual box
